

+MOLDED-OIL BEARINGS

As one of the world's leading manufacturers of rolling bearings, linear technology components and steering systems, we can be found on almost every continent – with production facilities, sales offices and technology centres – because our customers appreciate short decision-making channels, prompt deliveries and local service.

The NSK company

NSK commenced operations as the first Japanese manufacturer of rolling bearings back in 1916. Ever since, we have been continuously expanding and improving not only our product portfolio but also our range of services for various industrial sectors. In this context, we develop technologies in the fields of rolling bearings, linear systems, components for the automotive industry and mechatronic systems. Our research and production facilities in Europe, Americas and Asia are linked together in a global technology

network. Here we concentrate not only on the development of new technologies, but also on the continuous optimisation of quality – at every process stage.

Among other things, our research activities include product design, simulation applications using a variety of analytical systems and the development of different steels and lubricants for rolling bearings.

Partnership based on trust and trust based on quality

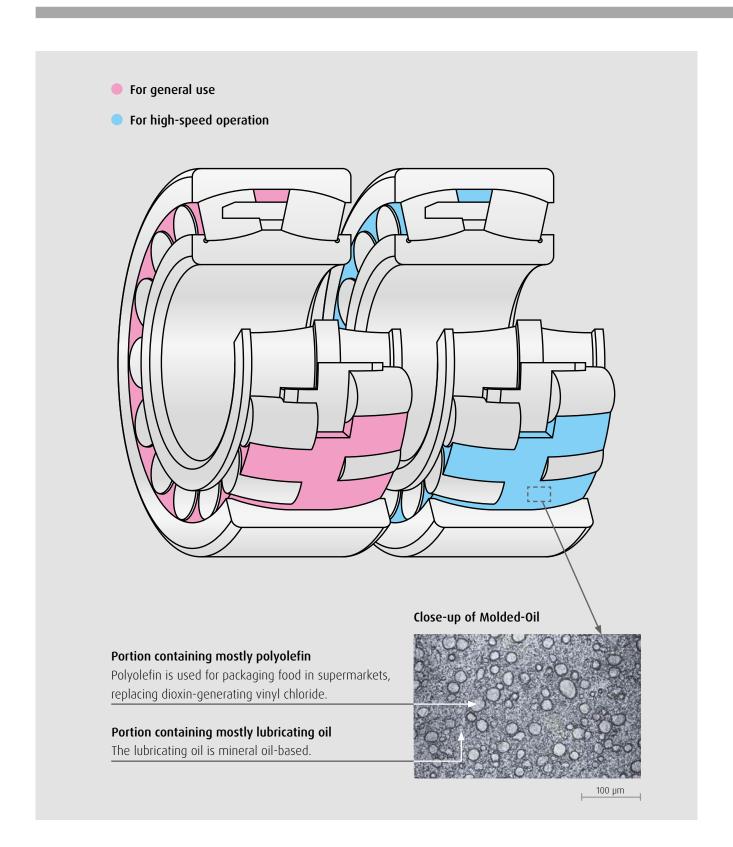

Total Quality by NSK: The synergies of our global network of NSK Technology Centres. Just one example of how we meet our requirements for high quality.

NSK is one of the leading companies with a long tradition in patent applications for machine parts. In our worldwide research centres, we not only concentrate on the development of new technologies, but also on the continual improvement

of quality based on the integrated technology platform of tribology, material technology, analysis and mechatronics. More about NSK at www.nskeurope.com or call us on +44(0)1636605123

Molded-Oil Bearings

Molded-Oil Bearings are lubricated with NSK's own oil-impregnated material – Molded-Oil – which consists of lubricating oil and polyolefin resin that has an affinity for oil. Lubricant slowly seeping from this material provides ample lubrication to the bearing for extended periods.

Features of Molded-Oil Bearings

 Excellent performance in water- and dustcontaminated environments

The bearings are designed to prevent liquids such as water (which can wash the lubricating oil out) and dust from getting inside the bearings. Sealed types can be used in environments exposed to water and dust.*

- > Environmentally friendly
 - Because they can be lubricated with minute quantities of oil that exudes from Molded-Oil, the bearings are able to minimise oil leakage.
- Low torque
 - Packing with Molded-Oil after providing the bearing surface with special treatment realises smooth rotation of rolling elements.
- Optimal composition and molding methods enable high-speed operation of Molded-Oil Bearings Optimisation of composition and molding method of Molded-Oil improves strength and enables high-speed operation of Molded-Oil Bearings.

Applications

- > Steel mill equipment
- Paper mill equipment
- Liquid crystal display and semiconductor manufacturing equipment
- Agricultural machines
- Food processing equipment
- Cleaning equipment and lines
- Conveying equipment

^{*} Water and dust dramatically accelerate bearing damage. In order to realise stable operation, we recommend using seals to prevent water and dust from getting in the bearing.

Tapered roller bearing HR32013XJL11

For general use

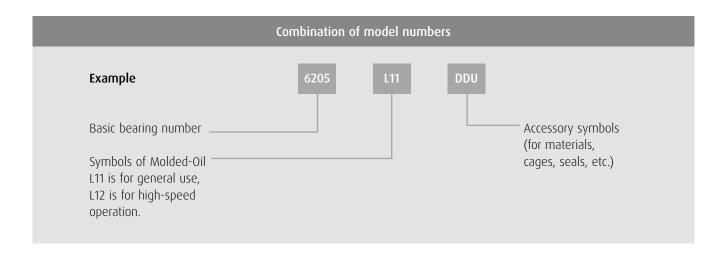

^{*} The bearings come with seals on both sides.

Bearing Model Numbers

Handling Precautions

To maintain the excellent long-term lubricating capacity of Molded-Oil Bearings, the following precautions should be observed:

- Molded-Oil melts at about 120°C, therefore the bearings must not be heated over 100°C by using an induction heater. Additionally, the bearings should not be heated by the oil bath method.
- The bearings should not be used under conditions involving liquid degreasing agents such as organic solvents that can affect Moded-Oil. The bearings also should not be used under conditions involving corrosive liquids or gases that can damage the parts of the bearing.

Samples of model numbers

| Bearing types | Molded-Oil types | | Model numbers | Remarks | |
|------------------------------|------------------|--------------------------|--------------------|-------------------------|--|

Bearing Types and Availability

Available Molded-Oil Bearing type, cage type, limiting speed, and size (outside diameter, mm)

| Bearing types | Molded-Oil types | | Cage types | Limiting speeds (d _m n) | Sizes (outside diameter, mm) | |
|---------------------------|--------------------------------|--------------------------------|---------------------|---------------------------------------|---------------------------------|--|
| | | F (144) | Machined brass (CA) | < 60,000 | 70 ≤ AD ≤ 250 | |
| Spherical roller bearings | For general use (L11) | Pressed steel (EA) | < 30,000 | 70 ≤ AD ≤ 215 | | |
| | • | For high-speed operation (L12) | Machined brass (CA) | 60,000 - 100,000 | 70 ≤ AD ≤ 215 | |
| | | For general use (L11) | Pressed steel | < 150,000 | 19 ≤ AD ≤ 250 | |
| Deep groove ball bearings | For high-speed operation (L12) | | Pressed steel | 150,000 - 200,000 | 19 ≤ AD ≤ 215 | |
| Tapered roller bearings | • | For general use (L11) | Pressed steel | < 40,000 | 80 ≤ AD ≤ 215 | |

- \rightarrow d_mn = [(Bearing bore diameter, mm + Bearing outside diameter, mm) \div 2] x inner ring rotational speed, min⁻¹
- > Some large spherical roller bearing numbers may not be available
- Conditions including abutment and fillet dimensions must be taken into consideration for tapered roller bearings
- > For tapered roller bearings and spherical roller bearings with pressed steel cages (EA), Molded-Oil Bearings for high-speed operation (L12) are not available
- > For the application under the condition of low speed and low temperature, Molded-Oil Bearings for general use (L11) are recommended

Limiting speeds (d_mn) of "a" to "d" shown above are examples for general housing. If there is a source of heat near the bearings, or the cooling effect by the radiation or the heat transmission, the above limiting speed cannot be expected due to the application.

Precautions for Selecting

The following precautions should be considered to maintain the high performance of Molded-Oil Bearings:

- > For low-temperature applications, Molded-Oil Bearings for general use (L11) are recommended.
- > For the condition of high ambient temperature, Molded-Oil Bearings for high-speed operation (L12) are recommended.
- > To rotate the bearings properly, it is necessary to apply the radial load. As a standard of the radial load, more than 1% of the basic dynamic load rating is recommended.
- > Since Molded-Oil Bearings are lubricated by oil seeped from a Molded-Oil, the bearings cannot be used under the condition where the bearings are exposed to water directly for an extended period of time (the oil could be washed away). If the application requires such exposure, consider using extra seals.

Performance Test

Molded-Oil Bearings feature a number of excellent functions. Extensive test data and field results demonstrate the outstanding performance of Molded-Oil Bearings.

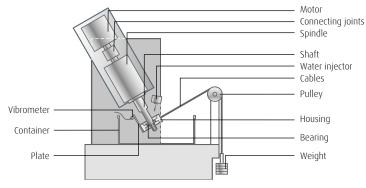

Durability test under conditions of exposure to water

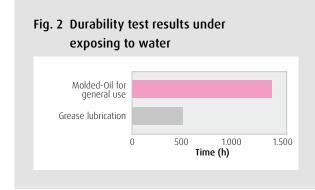

Grease lubrication allows operation for extended periods of time even if exposed to mist or submerged in water. Continuous operation with grease lubrication: approximately 20 days; with Molded-Oil Bearings: 50 days or more Molded-Oil Bearings can be operated for longer time than the bearings with grease lubrication even if exposed to mist or submerged in water.

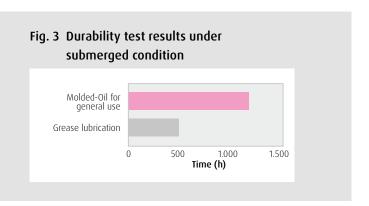

| Environment where exposed to water – cleaning equipment is assumed | | | | | | |
|---|------------------|--|--|--|--|--|
| | Test bearings | 6000-H-DD (stainless steel with contact seal) | | | | |
| | Rotational speed | 1,000 min ⁻¹ | | | | |
| Test conditions | Radial load | 79.4 N | | | | |
| Conditions | Axial load | 29.4 N | | | | |
| | Water exposure | 0.8 cm ³ /min | | | | |
| | Spray pressure | 0.2 MPa | | | | |

| Environment of submerged condition – under water vehicle and facilities are assumed | | | | | | |
|--|------------------|--|--|--|--|--|
| | Test bearings | 6000-H-DD (stainless steel with seal) | | | | |
| Test conditions | Rotational speed | 1,000 min ⁻¹ | | | | |
| Conditions | Radial load | 79.4 N | | | | |
| | Axial load | 29.4 N | | | | |

Fig. 1 Testing device under conditions of exposure to water

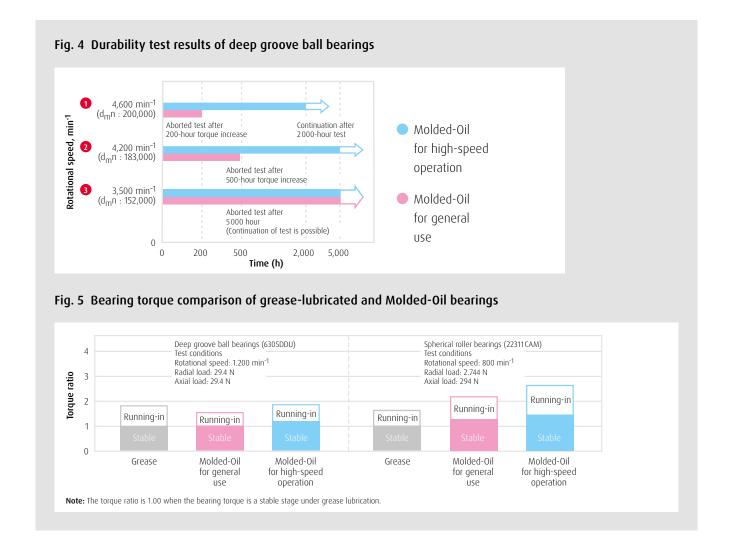

Durability performance test

Slow seeping of the lubricant from Molded-Oil provides excellent lubrication performance for extended periods. Molded-Oil Bearings for general use cannot be used under conditions of high-speed rotation, but Molded-Oil Bearings for high-speed operation perform with excellent durability under such conditions.

| Durability performance test | | | | | | | |
|-----------------------------|------------------|---|--|--|--|--|--|
| | Test bearings | 6305DDU | | | | | |
| | Radial load | 98 N | | | | | |
| Test conditions | Axial load | 245 N | | | | | |
| rest conditions | | 1 3,500 min ⁻¹ (d _m n : 152,000) | | | | | |
| | Rotational speed | 2 4,200 min ⁻¹ (d _m n : 183,000) | | | | | |
| | | 3 4,600 min ⁻¹ (d _m n : 200,000) | | | | | |
