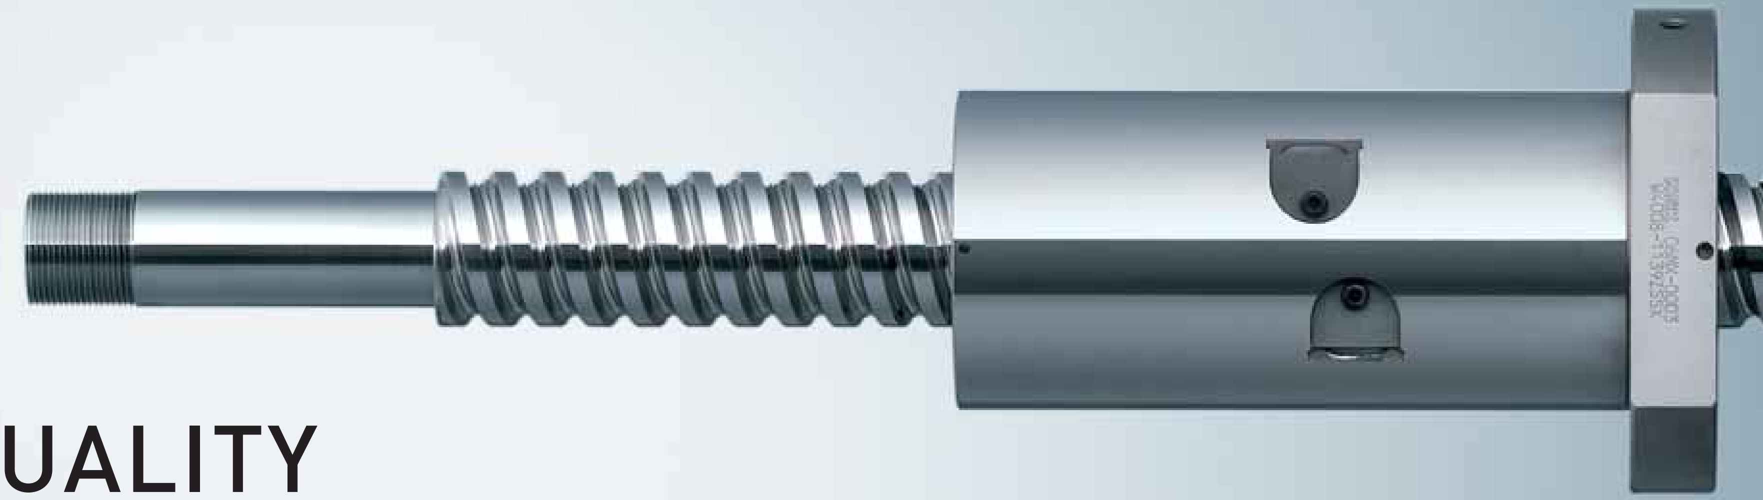
GLOBAL BRAND

NSK products are known and used all over the world

Since 1916, when it was the first company in Japan to produce ball bearings, NSK has contributed to industrial growth both domestically and overseas for 90 years. Now, the company's accumulated technology in bearings has been applied to precision products in order to support core components used in a variety of machinery. Precision products marketed under the trusted NSK brand, such as Ball Screws, Linear Guides, Monocarriers, mechatronic products, and Spindles are found in every corner of the globe.



TOTAL QUALITY

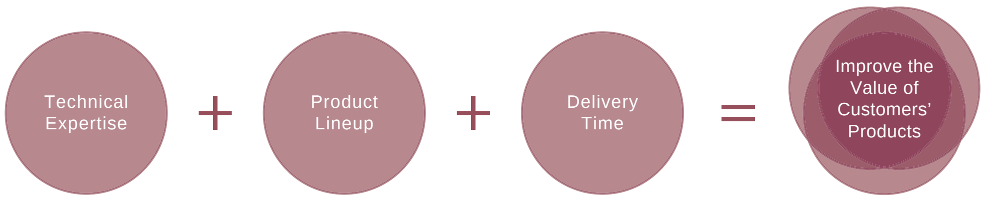
Focus on customers' total quality

Product quality is essential for manufacturers. NSK builds on its solid foundation of quality to enhance its ability to offer solutions that add value for customers, taking advantage of capabilities afforded by supply chain management (APS: Advanced Production System), and further extending its technical expertise based on four core technologies. Quality is the objective in all our business processes toward becoming "No. 1 in Total Quality."

SOLUTIONS

Improvement of customers' product value by technical support

Solutions only NSK can propose are contributing to the advancement of manufacturing for a new era.

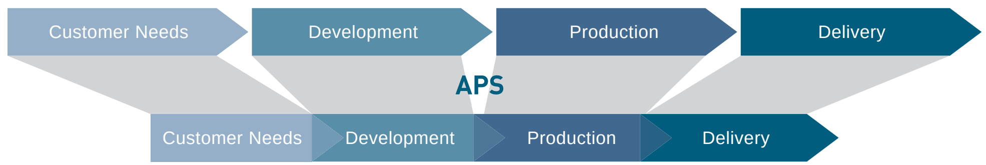


With its Technology Center as the cornerstone, NSK is able to provide technical support worldwide and quickly offer innovative solutions. We are able to more rapidly deliver the required products by combining a global production system with a broad lineup that includes precision products and bearings. These detailed solutions and technical support efforts enable us to enhance the value of our customers' products and thereby deepen our partnerships with those customers.

APS

Advanced production system for speed, quality and global supply chain management

NSK has streamlined operations to cut lead times and achieve faster delivery.

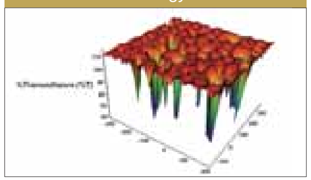


To more effectively respond to customer needs, NSK implemented APS (Advanced Production System) encompassing sales, development, design, manufacturing and distribution. Under our APS, we established a project for streamlining operations to shorten lead times. As a result, the system has boosted supply capacity and directly addressed customer demand.

TECHNOLOGY

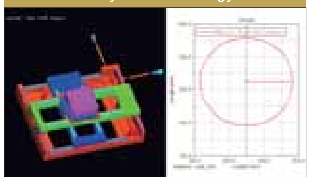
Developing innovative technologies and
products by our four core technologies

Tribology



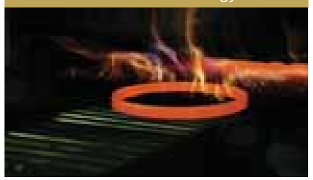
Precision products with rotational and linear movement require lubrication that supports high speed, low noise operation, load capacity, durability, and other desirable functionality. NSK has applied, and provided to customers, advanced tribology (friction control technology) to such areas as grease, solid lubricants, and surface processing methods for precision products.

Analysis Technology



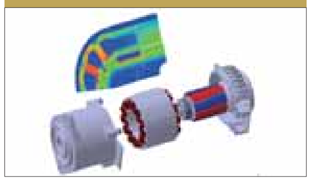
NSK utilizes computer simulations to conduct virtual experiments that require high precision or are difficult to run under actual machine operating conditions. Further improvements in analysis technology have accelerated product development.

Materials Technology



We are aggressively striving to advance material technology through material design, thermal treatment, performance evaluation, and analysis as the cornerstone for improving product performance and durability as well as for reducing costs and boosting productivity.

Mechatronics



Our mechatronics, which integrate mechanical and electronic elements, incorporates state-of-the-art advances in high-performance motors along with control and sensor technology.

Environmental Initiatives

Approach and Basic Policy for Development and Design

In its Environmental Code of Conduct, the NSK Group aims to develop technology and create products that reduce environmental impact. NSK Group products are incorporated into various machines and devices and have the ability to control friction and reduce the amount of energy consumed. In the product development and design stage, importance is placed on comfort, preservation of natural resources, and energy conservation at the end-user stage, as well as on reducing the environmental impact of the manufacturing process. Therefore, initiatives are being promoted to utilize the environmental features of NSK products. In fiscal 2001, a basic policy affecting all technical departments was established in order to steadily implement these goals.

Basic Policy for the Development of Environmentally Friendly Products

The NSK Group will minimize the environmental impact of its products at every stage—from R&D and design, to production, usage, and disposal—by upholding the following standards:

1. Each product should contribute toward the energy and resource conservation by the machine in which it is installed.
2. The amount of energy and resources required during product manufacturing should be minimal.
3. Environmentally harmful substances should not be used in products or manufacturing processes.
4. Products should contribute to the health and safety of end-users by having low emissions of vibration, noise, and dust.

Green Procurement Policy

The NSK Group actively procures products, parts, and materials based on environmental considerations. By managing environmentally harmful substances with its suppliers, NSK is strengthening its environmental quality assurance system for its products.

Green Procurement Standards

The NSK Group must deliver products that ensure satisfaction and meet the ever-stricter requirements of customers and European regulations. Therefore, NSK has established standards for procurement such as the Master Purchase Agreement and the *Green Procurement Standards*, based on the idea that ecological considerations for parts and material procurement are indispensable to environmental protection. The company has asked its suppliers to cooperate in this effort.

Research & Development
NSK's research system takes full advantage of knowledge on technology shared through its information network.

Precision Machinery and Parts Technology Center
Maebashi, Gunma

The Precision Machinery and Parts Technology Center plays a vital role in developing next-generation precision products in cooperation with NSK's Research and Development Center. For new products or those used for special purposes, reliability testing is essential. Each technology division has introduced instruments developed by NSK to evaluate the various aspects of product performance. Experiments conducted by the Center are designed according to specific application conditions, such as operating life and durability. The Center also undertakes vacuum environment testing for semiconductor and LCD manufacturing equipment as well as sound and vibration testing. In addition, accumulated test data is stored in a database, which has proved to be a valuable resource. The Center is constantly striving to develop new industry-leading products.

Fujisawa Research and Development Center
Fujisawa, Kanagawa

The Fujisawa Research and Development Center supports the future of NSK by conducting research and development into innovative technologies, such as tribology, analysis technology, materials technology, and mechatronics. This Center develops high added-value, next-generation products by broadly disseminating data and exchanging information with the Precision Machinery and Parts Technology Center and R&D centers in the Americas, Europe and Asia.

Manufacturing Bases
Global manufacturing bases assist in maintaining the high-quality "NSK brand."

NSK Precision Co., Ltd. Maebashi Precision Machinery and Parts Plant
Maebashi, Gunma

As a production base for precision machinery components, the Maebashi Precision Machinery and Parts Plant manufactures world-class products, including large Ball Screws and Monocarriers, by fully applying state-of-the-art techniques based on the highest level super-precision technologies. NSK's own production methods ensure meticulous quality control throughout the entire production process.

Products: Ball Screws, Monocarriers, XY Tables, Support Units

NSK Precision Co., Ltd. Saitama Precision Machinery and Parts Plant
Hanyu, Saitama

The Saitama Precision Machinery and Parts Plant manufactures Linear Guides that are widely used in machine tools, transportation systems, and other applications. With its ground-breaking processing technology and thorough factory automation, the plant contributes to enhancing customer satisfaction by producing high-quality products.

NSK Kyushu Co., Ltd.
Ukiha, Fukuoka

As the world's No. 1 production base for small precision Ball Screws, NSK Kyushu Co., Ltd. is striving to realize unsurpassed QCD (quality, cost, delivery) and earn customer trust. NSK Kyushu Co., Ltd. endeavors to shorten delivery time with NSK's proprietary production management system.

Products: Ball Screws

NSK Precision America, Inc. Franklin Plant
Indiana, U.S.A.

Established in 1993, this plant serves as a production base for Ball Screws. It actively supplies Linear Guides and mechatronic products to meet a wide range of market needs in such areas as machine tools, semiconductors, medical equipment and general industrial applications. The plant also promotes various projects and advanced production system (APS) activities in concert with other plants in Japan to achieve further advances toward even faster delivery systems to meet the demands of a broader market.

Products: Ball Screws, XY Tables

NSK Precision UK, Ltd. Newark Plant
Nottinghamshire, U.K.

The Newark Plant was established in 1998 as a Linear Guide production base that supports short-term delivery along with a European warehouse, a sales base in Europe, and a workshop. The plant is part of a system that covers not only major markets in Europe but also general industrial markets in Eastern Europe and the Middle East. It also pursues streamlining in accordance with globalization and plays an active role as a global sourcing facility by supplying products to the Americas.

Preface

It is our pleasure to announce the publication of a new catalog which contains all NSK linear motion products. We believe this publication is one way to show our deep appreciation of your patronage.

Market demand for more sophisticated and diversified machines and equipment is rapidly escalating. NSK precision products are not only used widely in these machines, but also are crucial elements.

In response to this trend, ball screws, NSK linear guides, and Monocarriers, which are crucial mechanical components of these machines, are required to be highly reliable, maintenance-free, smaller in size and lightweight. They also are expected to heighten efficiency and satisfy uses in special environment.

Publishing a catalog to introduce our entire product line is especially meaningful under such circumstances.
This is an improved version of the previous catalog; products are categorized, and each product category has two sections. The first section contains an explanation of products for selection and a technical explanation including results of the latest experiments and research to assist thorough technological discussion. The second half is dimension tables. Last, "Other," whose pages are in color, explains special environments and lubrications such as grease, which are general issues for NSK precision products.

We hope abundant NSK products in the new catalog will be your aide in selecting the most suitable products for your purpose.
We solicit your continued patronage.

A BLOCK NSK Linear Rolling Guide Product

Precision Machine Components <Linear Rolling Guide Product> Contents

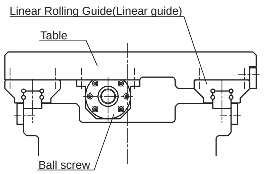
A-1 Characteristics of NSK Linear Rolling Guides

Characteristics of the NSK linear rolling guides are:

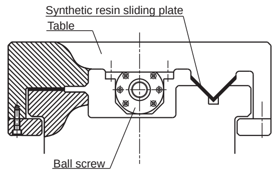
- Designs are simple and economic. This contributes to highly accurate and low cost machines.
- Low friction coefficient facilitates a compact and low cost driving mechanism.
- Ultra-high purity of materials and superb processing technology provide long-term highly reliable operation.
- Prompt delivery thanks to interchangeable components variation.
- The user can select the most suitable guide from a variety of the ball guides and roller guides.

A-1-1 Comparision of Rolling Guides and Sliding Guides

The following describes a characteristic comparison between general rolling and sliding guide.



Example of rolling guide



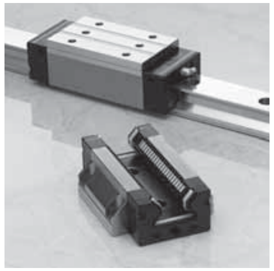
Example of sliding guide

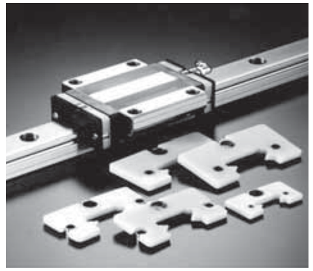
Comparative characteristics of rolling and sliding guide way

Function	Rolling guide	Sliding guide
Friction	• Friction coefficient: 0.01 or lower • Difference between static and dynamic friction is small. • Change by speed is slight.	• Friction is great. • The difference between static and dynamic friction coefficient is great.
Positioning accuracy	• Lost motion is slight. • Stick-slip is slight. • Easy to achieve sub-micron positioning	• Lost motion is great. • Stick-slip at low speed is great. • Difficult to achieve sub-micron positioning
Life	• Possible to estimate useful life	• Difficult to estimate useful life
Static rigidity	• Generally high • No play because of preload • Easy to estimate rigidity	• Rigidity is great against load from a particular direction. • There is mechanical play. • Difficult to estimate rigidity
Speed	• Wide range of use from low to high speed	• Unsuitable for extremely low or high speed
Maintenance, reliability	• Long life through simple maintenance	• Precision is lost greatly by deteriorated guide surface.

In response to the demand for guideways with high-speed, high-precision, high-quality, as well as to the demand for easy maintenance, rolling guides which have above features are becoming prevalent. Utilizing the technology we sharpened in anti-friction rotating bearings, NSK makes various types of rolling linear guides which are highly accurate and reliable.

A-1-2 Structure and Characteristics of NSK Linear Guides





(1) Structure of NSK Linear Guides

By avoiding structural complexity, and by reducing the number of components, we not only enhanced the precision of linear guides, but also are able to keep costs low. We have added NSK's patented unique structural feature to the original invention (Fig. 1). This contributes to higher precision and lower prices.
NSK linear guide consists of a rail and a ball or roller slide (Fig. 2). The balls or rollers roll on the race way surface, and are scooped up by the end caps attached to both ends of the ball or roller slide. Then, the balls or rollers go through a passage made in the ball or roller slides and circulate back to the other end.

(2) Characteristics of NSK Linear Guides

The use of a unique offset Gothic arch groove (Fig. 3) allows the ball type of NSK linear guides to satisfy groove designs required for specific purposes.
This unique ball groove design facilitates precise measurement of the ball groove, thus enabling stable and highly accurate production of the ball slides and the rails for random matching. (Fig. 4)
On top of that, we have developed and marketed the NSK Roller Guides, representing the culmination of NSK's analysis technology and tribology.
Such technologies ensure the feature of NSK linear guides outlined below.

1 High precision and quality

- High precision and quality come from our superb production and measuring technologies, strengthened by extensive experience in antifriction rotary bearings and ball screw production. Our quality assurance extends to the smallest components.

2 High reliability and durability

- Logical simplicity in shape, along with stable processing, maintains high precision and reliability.
- Super-clean materials, our advanced heat treatment and processing technologies increase product durability.

3 Abundant in type for any purpose

- Various series are available, and their slide models and size categories are standardized to satisfy any requirement. Our technology, polished by abundant experience in the use of special materials and surface treatments, meets the customer's most demanding expectations.

4 Development of random-matching parts for short delivery time

- The adoption of the Gothic arch groove which makes measuring easy, and a reliable quality control method has made random-matching of the rails and the ball slides possible. The parts are stocked as standard products, thereby reducing delivery time.

5 Patented static load carrying capacity (impact-resistance)

- When a super-high load (impact) is applied, our Gothic arch groove spreads the load to contact surfaces which usually do not come into contact in ball type. This increases shock resistance (Fig. 5).

6 Lineup of extremely high-load capacity series

- The LA series provides a top class high-load capacity for the ball linear guides through a unique load carrying configuration with three ball recirculation circuits on the one side.
  By installing rollers that are the largest possible diameter and length, the NSK roller linear guides have realized the world highest load capacity, far superior to the roller linear guides of other companies.

NSK added its patented technology to the invention in Fig. 1, and improved the linear guide structure and realized low cost design.

Measuring grooves is easy. You can obtain highly accurate results for all types of NSK series. This is why you can purchase rails and slides separately for random matching.

A-3-2 Rating Life and Basic Load Rating

A-3-2.1 Life and Basic Load Rating

(1) Life

Although used in appropriate conditions, the linear guide deteriorates after a certain period of operation, and eventually becomes unusable. In broad definition, the period until the linear guide becomes unusable is called "life." There are "fatigue life " caused by flaking, and "life of accuracy deterioration" which is caused by wear.

(2) Rating fatigue life

When the linear guide runs under load, the rolling elements and the rolling contact surface of the grooves are exposed to repetitive load. This brings about fatigue to the material, and generates flaking. Flaking is scale-like damage to the surface of the rolling contact surface.

Total running distance until first appearance of flaking is called "fatigue life." This is "life" in the narrow sense. Fatigue life varies significantly even in linear guides produced in the same lot, and even when they are operated under the same conditions. This is attributable to the inherent variation of the fatigue of the material itself.

"Rating fatigue life" is the total running distance which allows 90% of the group of linear guides of the same reference number to run without causing flaking when they are independently run under the same conditions. Rating fatigue life is sometimes indicated by total operating hours when the linear guides run at a certain speed.

(3) Basic load ratings in compliance with ISO standard

NSK calculates the basic load rating in compliance with ISO standard.

The basic load rating as listed in "**A-5 Linear Guide Dimension Table**" comply with the ISO standard.

ISO : International Organization for Standardization

[Basic dynamic load rating]

ISO 14728-1 ; Rolling bearings — Linear motion rolling bearings

Part 1: Dynamic load ratings and rating life

[Basic static load rating]

ISO 14728-2 ; Rolling bearings — Linear motion rolling bearings

Part 2: Static load ratings

(4) Basic dynamic load rating

- Basic dynamic load rating, which indicates load carrying capacity of the linear guide, is a load whose direction and volume do not change, and which furnishes 50 km of rating fatigue life.
- In case of linear guide, it is a constant load applied to downward direction to the center of the slide.
- Value of basic dynamic load rating C is shown in "**A-5 Linear Guide Dimension Table.**"
- NSK defines the basic dynamic load rating as the load that furnishes 50 km of rated fatigue life. However some linear guide manufacturers in Europe and the United States define the load for the basic fatigue life of 100 km as the basic dynamic load ratings.
- The following formula may be used to convert the basic dynamic load rating C_{50} into the dynamic load rating for 100 km rated fatigue life.

For balls as rolling element : $C_{100} = C/1.26$ (N)

For rollers as rolling element : $C_{100} = C/1.23$ (N)

(5) Calculation of rating fatigue life

- In general, rating fatigue life "L" can be calculated from basic dynamic load rating "C" and the load "F" to slide using the following formula.

For balls as rolling element : $L = 50 \times \left(\dfrac{C}{F}\right)^{3}$

For rollers as rolling element : $L = 50 \times \left(\dfrac{C}{F}\right)^{\frac{10}{3}}$

L : Rating fatigue life (km)

C : Basic dynamic load rating (N) (50 km)

F : Load to a slide (N) (dynamic equivalent load)

- The rating fatigue life L for 100 km can be obtained from the following formulas using the dynamic load rating C_{100}.

For balls as rolling element : $L = 100 \times \left(\dfrac{C_{100}}{F}\right)^{3}$

For rollers as rolling element : $L = 100 \times \left(\dfrac{C_{100}}{F}\right)^{\frac{10}{3}}$

L : Rating fatigue life (km)

C_{100} : Dynamic load rating for 100 km (N)

F : Load to a slide (dynamic equivalent load) (N)

(6) Dynamic equivalent load

- Load applied to the linear guide (slide load) comes from various directions up/down and right/left directions and/or as moment load. Sometimes more than one type of load is applied simultaneously. Sometimes volume and direction of the load may change.

Varying load cannot be used as it is to calculate life of linear guide. Therefore, it is necessary to use a hypothetical load to slide with a constant volume which would generate a value equivalent to an actual fatigue life. This is called "dynamic equivalent load." For actual calculation, refer to "**A-3-2.2 (3)**"

(7) Basic static load rating

- When an excessive load or a momentary large impact is applied to the linear guide, local permanent deformation takes place to the rolling elements and to the rolling contact surface. After exceeding a certain level, the deformation hampers smooth linear guide operation.
- Basic static load rating is a static load when: [Permanent deformation of the rolling elements] + [permanent deformation of the rolling contact surfaces] becomes approximately 0.0001 times of the rolling element diameter.
- In case of linear guide, it is a load which is applied in downward direction to the center of the slide.
- Values of basic static load rating C_0 are shown in "**A-5 Linear Guide Dimension Table.**"

(8) Basic static moment load rating

- Generally, NSK linear guide uses a set of two rails and four slides for the guide way of one axis. Under some operating condition, static moment load should be taken into account.

"M_0," which is the limit of static moment load , and calculated from permanent deformation in such use is shown in "**A-5 Linear Guide Dimension Table.**"

(9) Basic load rating by load direction

- The basic load rating is considered to be a downward load to the slide and is indicated in the dimension tables as the dynamic load rating C and the static load rating C_0 respectively. However, the load may be applied to a slide in upward or lateral directions in actual use. In such a case the basic load rating shall be compensated as shown in Table 2.1. The basic dynamic load rating of the RA and LA Series is the same in C and C_0 for all load directions, up, down and lateral, while the LH Series has different basic load ratings by the load direction as shown in the table.

Table 2.1 Basic load ratings by load direction

Load rating / Load direction / Series	Basic dynamic load rating			Basic static load rating		
	Downward	Upward	Lateral	Downward	Upward	Lateral
SH, SS, LH, LS, VH, HS, LW	C	C	$0.84C$	C_0	$0.78C_0$	$0.65C_0$

A-3-2.2 How to Calculate Life

(1) Setting operating condition of linear guide

- First, set operating conditions to determine whether the temporarily selected model satisfies the required life.
- Major operating conditions are as follows. Set all values to calculate applied loads to each slide (Refer to Table 2.2).

Axis set up	: Horizontal, vertical
Rail combination	: Single rail, multiple rail
Applying loads	: F_x, F_y and F_z (N)
Slide span	: l (mm)
Rail span	: L (mm)
Position of load action point	: X, Y, Z (mm)
Center of driving mechanism	: X_b, Y_b, Z_b (mm)
Operating speed	: V (mm/sec)
Time in acceleration	: t (sec)
Operating frequency (duty cycle)	

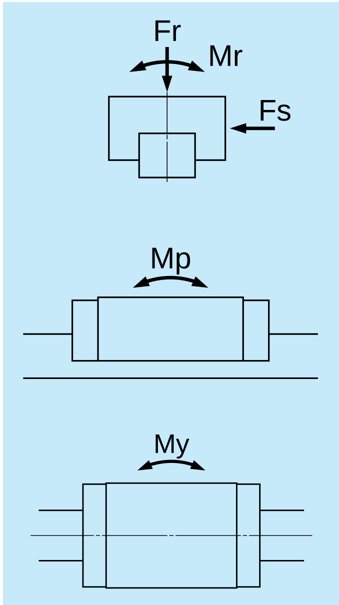

Fig. 2.1

(2) Calculating load to a slide

- Table 2.2 shows a formula to calculate loads that are going to be applied to each assembled slide into a machine.
  The Table shows six typical patterns of linear guide installing structure.
- In the Tables, directions indicated by arrows denote "plus" for the applied loads (F_x, F_y, F_z) and the loads which are applied to the slide. (F_r, F_s, M_r, M_p, M_y).
- Codes in the Tables are as follows:
  F_r : Vertical loads to the slide (N)
  F_s : Lateral loads to the slide (N)
  M_r : Rolling moment to the slide (N · mm)
  M_p : Pitching moment to the slide (N · mm)
  M_y : Yawing moment to the slide (N · mm)
  Suffixes (1, 2, ...) to the above F_r – M_y : Slide number
  F_{xi} : Load applied in X direction (i = 1 – n; n is the number of loads applied in X direction) (N)
  F_{yj} : Load applied in Y direction (j = 1 – n; n is the number of loads applied in Y direction) (N)
  F_{zk} : Load applied in Z direction (k = 1 – n; n is the number of loads applied in Z direction) (N)
  Coordinates (X_{xi}, Y_{xi}, Z_{xi}): Point where load F_{xi} (mm) is applied.
  Coordinates (X_{yj}, Y_{yj}, Z_{yj}): Point where load F_{yj} (mm) is applied.
  Coordinates (X_{zk}, Y_{zk}, Z_{zk}): Point where load F_{zk} (mm) is applied.
  l: Slide span (mm)
  L: Rail span (mm)
  Coordinates (X_b, Y_b, Z_b): Center of driving mechanism

Definitions of codes appearing at the end of the model number in Table 2.4:

L	: Super-high-load type	; LH45L
S	: Medium load type	; LS25S
No code	: High-load type	; LY45_
A	: Ball slide shape is square	; LH30A (only LH30 and SH30)
EF	: Ball slide shape is flanged type (EL, FL type)	; LH30EF (only LH30 and SH30)
R	: Miniature Series with ball retainer	; LU09R

• Formula is determined by the relationship of loads in terms of volume. Full dynamic equivalent load can be easily obtained by using each coefficient.
After obtaining the dynamic equivalent load of the necessary load directions from Table 2.4, use the formulas below to calculate full dynamic equivalent loads.

- When ***F*r** is the largest load : ***F*e = *F*r + 0.5*F*se + 0.5*F*re + 0.5*F*pe + 0.5*F*ye**
- When ***F*se** is the largest load : ***F*e = 0.5*F*r + *F*se + 0.5*F*re + 0.5*F*pe + 0.5*F*ye**
- When ***F*re** is the largest load : ***F*e = 0.5*F*r + 0.5*F*se + *F*re + 0.5*F*pe + 0.5*F*ye**
- When ***F*pe** is the largest load : ***F*e = 0.5*F*r + 0.5*F*se + 0.5*F*re + *F*pe + 0.5*F*ye**
- When ***F*ye** is the largest load : ***F*e = 0.5*F*r + 0.5*F*se + 0.5*F*re + 0.5*F*pe + *F*ye**

For the values of each dynamic equivalent load in the formulas above, disregard load directions and take the absolute value.

(4) Calculation of mean effective load

When the load to the slide deviates, obtain a mean effective load which becomes equal to the life of slide under variable load conditions. If the load does not vary, use the dynamic equivalent load as it is.

① When load and running distance vary stepwise (Fig. 2.3)

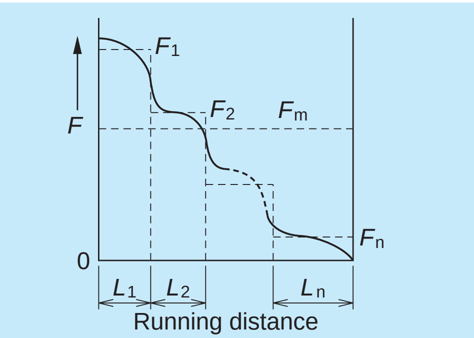

Fig. 2.3 Stepwise load change

Running distance while dynamic equivalent load F_1 is applied: L_1

Running distance while dynamic equivalent load F_2 is applied: L_2

Running distance while dynamic equivalent load F_3 is applied: L_3

• • • • • • • • • • • • • • • • • •

Running distance while dynamic equivalent load F_n is applied: L_n

From the above, mean effective load *F*m can be obtained by the following formula.

In case of ball

$$Fm = \sqrt[3]{\frac{1}{L}(F_1^3 L_1 + F_2^3 L_2 + \ldots\ldots + F_n^3 L_n)}$$

In case of roller

$$Fm = \sqrt[\frac{10}{3}]{\frac{1}{L}(F_1^{\frac{10}{3}} L_1 + F_2^{\frac{10}{3}} L_2 + \ldots\ldots + F_n^{\frac{10}{3}} L_n)}$$

*F*m : Mean effective load of the deviating load (N)

L : Running distance (ΣLn)

② When load changes almost lineally (Fig. 2.4)

Approximate mean effective load *F*m can be obtained by the following formula.

$$Fm \fallingdotseq \frac{1}{3}(Fmin + 2Fmax)$$

*F*min : Minimum value of dynamic equivalent load (N)

*F*max : Maximum value of dynamic equivalent load (N)

③ When load changes in sinusoidol pattern (Fig. 2.5)

At time of (a): *F*m = 0.65 *F*max

At time of (b): *F*m = 0.75 *F*max

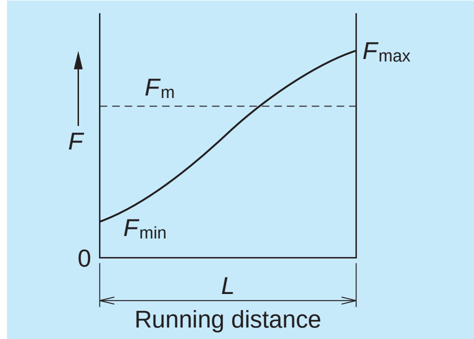

Fig. 2.4 Linear load change

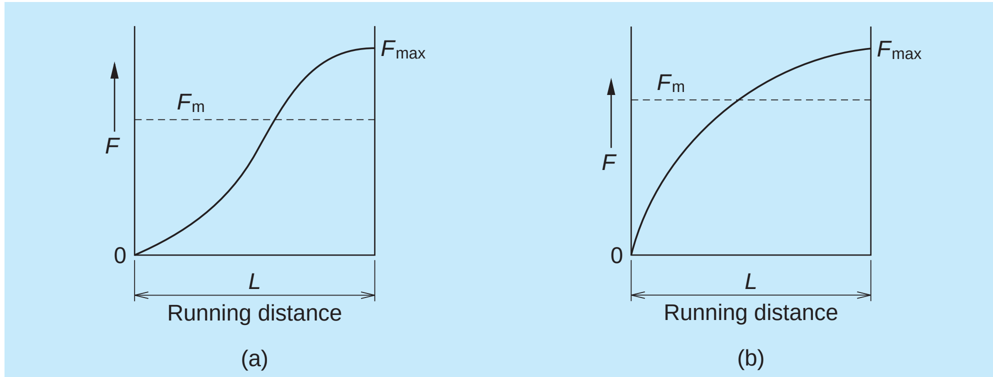

Fig. 2.5 Load that changes in sinusoidal pattern

(5) Various coefficients

① Load factors

- Although a load applied to the slide can be calculated, the actual load becomes larger than the calculated value due to the machine's vibration and impact.
- Therefore, calculation of load on the slide should take into consideration the load factors in Table 2.5.

Table 2.5 Load factor fw

Impact/Vibration	Load factor
No external impact/ vibration	1.0 – 1.5
There is impact/ vibration from outside.	1.5 – 2.0
There is significant impact/vibration.	2.0 – 3.0

② **Hardness coefficient**

- For linear guides, in order to function optimally, both the rolling elements and the rolling contact surface must have a hardness of HRC58 to 62 to an appropriate depth.
- The hardness of NSK linear guide fully satisfies HRC58 to 62. Therefore, in most cases it is not necessary to consider hardness. If the linear guide is made of a special material by a customer's request, as the material hardness is lower than HRC58, use the following formula for adjustment.

$$C_H = f_H \bullet C$$
$$C_{OH} = f_H' \bullet C_o$$

C_H : Basic dynamic load rating adjusted by hardness coefficient
f_H : Hardness coefficient (Refer to Fig. 2.6)
C_{OH} : Basic static load rating adjusted by hardness coefficient
f_H' : Static hardness coefficient (Refer to Fig. 2.6)

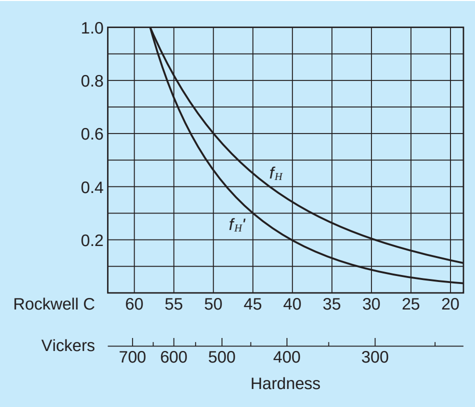

Fig. 2.6 Hardness coefficient

③ **Reliability coefficient**

- In general, a reliability of 90% is customary. In this case, reliability coefficient is 1. Therefore, the reliability coefficient does not have to be included in calculation.

(6) Calculation of rating life

Life Calculating Formula

Life calculating formula in the stroke movement with normal lubrication, the following relationships exist between slide mean effective load Fm (N), basic dynamic load rating to load application direction C (N), and rating fatigue life L (km).

$$L = 50 \times \left(\frac{f_H \cdot C}{f_w \cdot F_m}\right)^n \text{ (km)}$$

Ball linear guide bearing which uses balls n = 3
Roller linear guide bearing which uses rollers n = 10/3

f_H : Hardness coefficient
f_W : Load factor
Fm : Mean effective load

Use basic dynamic load rating C to calculate the life.

Note: Do not use basic static load rating C_0, and basic static moment rating M_{R0}, M_{P0} or M_{Y0}.

Life as an entire guide way system

In those cases when several slides comprise a single guide way system (such as a single-axis table), the life of the slide to which the most strenuous condition is applied is considered to be the life of the entire system.

For example, in Fig. 2.7, if "slide A" is the slide which receives the largest mean effective load, or if "slide A" is the one which has the shortest life, the life of the system is considered to be the life of "slide A."

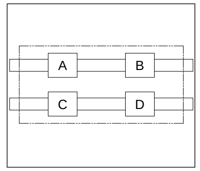

Fig. 2.7 Life of a system

(7) Examination of static load

① **Examine from basic static load rating**

- Examine static equivalent load P_0, which is applied to the slide, from basic static load rating C_0 and static permissible load factor fs.

$$fs = \frac{C_0}{P_0}$$

When static equivalent load P_0 is a combination of vertical loads Fr and lateral load Fs, calculate using formulas below.

For SH, SS, LH, LS, VH, HS and LW Series:

If compressed load and lateral load are combined

$$P_0 = Fr + 1.54Fs$$

If tensile load and lateral load are combined

$$P_0 = 1.28Fr + 1.54Fs$$

For RA, LA, HA, TS, PU, PE, LU, LE and LL Series:

$$P_0 = Fr + Fs$$

- The table below shows guidelines of fs for general industrial use.

Table 2.6

Use conditions	fs
Under normal operating conditions	1 – 2
Operating under vibration/impact	1.5 – 3

- Basic static load rating is not a destructive force to the balls or rollers, rails, or slide. The balls can withstand a load more than seven times larger than the basic static load rating . It is sufficient as a safety factor to the destruction load designed for general machines.
- However, when a heavy load applied to the rail and slide in tension direction, the strength of the bolt which secures rail and ball slide affects the strength of the entire system. Strength of the bolt and its material should be considered.

② **Examining from static moment load rating**

- Also examine static permissible moment load M_o from basic static moment load M_{po} and static permissible load factor fs.

$$fs = \frac{M_{p0}}{M_0}$$

If more than one moment load in any direction is combined, please consult NSK.

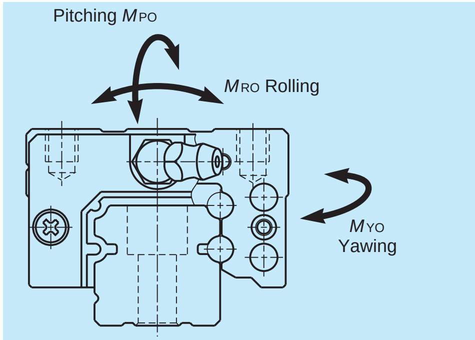

Fig. 2.8 Moment load directions

(8) Precautions for the design in examining the life

The following points must be heeded in examining the life.

In case of oscillating stroke

- If the rolling elements do not rotate all the way, but only halfway, and if this minute stroke is repeated, lubricant disappears from the contact surface of balls or rollers and raceways. This generates "fretting," a premature wear. Fretting cannot be entirely prevented, but it can be mitigated.
- A grease which prevents fretting is recommended for oscillating stroke operations. Using a standard grease, life can be markedly prolonged by adding a normal stroke travel (about the slide length) once every several thousand cycles.

When applying pitching or yawing moment

- Load applied to the rolling element rows inside the slide is inconsistent if pitching or yawing moment load is applied. Loads are heavy on the rolling elements on each end of the row.
- In such case, a heavy load lubricant grease or oil are recommended. Another countermeasure is using one size larger model of linear guide to reduce the load per rolling element.
- Moment load is insignificant for 2-rail, 4-slides combination which is commonly used.

When an extraordinary large load is applied during stroke

- If an extraordinary large load is applied at certain position of the stroke, calculate not only the life based on the mean effective load, but also the life based on the load in this range.
- When an extraordinary heavy load is applied and thus the application of high tensile stress to fixing bolts of the rails and slides is foreseen, the strength of the bolts should be considered.

When calculated life is extraordinarily short (Less than 3000 km in calculated life.)

- In such case, the contact pressure to the rolling elements and the rolling contact surface is extraordinarily high.
- Operated under such state continually, the life is significantly affected by the loss of lubrication and the presence of dust, and the actual life becomes shorter than calculated.
- It is necessary to reconsider arrangement, the number of slide, and the type of model in order to reduce the load to the slide.
- It is necessary to consider preload for calculation of rating life, when selecting Z3 (medium preload) or Z4 (heavy preload) as a preload. Please consult NSK.

Application at high speed

- The standard maximum allowable speed of a linear guide under normal conditions is 100 m/min. However, the maximum allowable speed can be affected by accuracy of installation, temperature, external loading etc.
- The end cap with high speed specification must be used when operating speed exceeds the permissible speed. Please consult NSK.

A-3-3 Preload

(1) Objective of preload

- An elimination of clearance between the raceways and rolling elements diminishes the mechanical play of the linear guide system.
- When a preload is applied, the deformation of linear guides by external vertical load is further improved thus increasing the system stiffness.
- Preloading method
  Rolling elements slightly bigger than the space of two raceways are inserted as shown Figure 3.1.

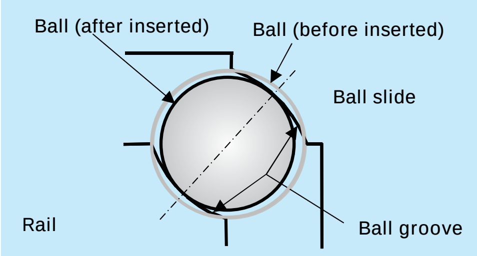

Fig.3.1 Preloading method

(2) Preload and rigidity

- In NSK linear guides, slight size changes rolling elements, which are going to be inserted in the slide, control clearance and amount of preload.
- In NSK linear guide, rigidity is further increased and elastic deformation is reduced by applying preload.
- In general, a load range of ball guide system in which the preload is effective becomes about 2.8 times of the preload (Fig.3.2). For roller guide system, it becomes about 2.2 times of the preload.
- Fig. 3.3 shows the relationship of ball slide deformation by external vertical load and preload. SH35 is used as a case.
- The following show the definition of linear guide rigidity.

1) Radial rigidity: Rigidity of vertical and lateral directions, up/down and right/left (Fig. 3.4).
2) Moment rigidity: Three moment directions, pitching, rolling, and yawing (Fig. 3.5).

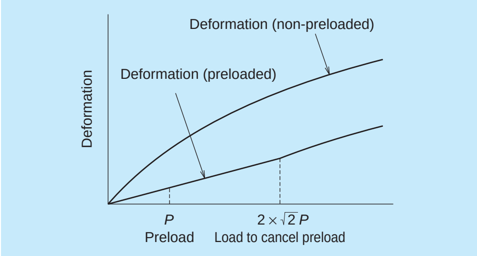

Fig. 3.2 Elastic deformation

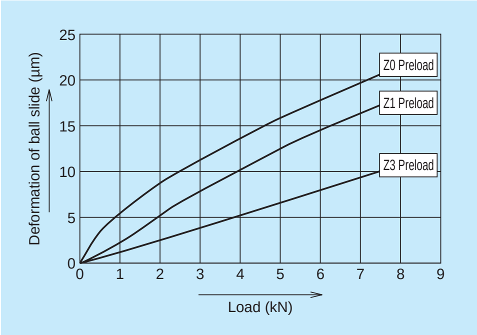

Fig. 3.3 Rigidity of SH35, downward direction load (example)

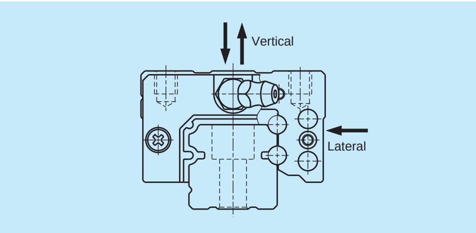

Fig. 3.4 Radial rigidity

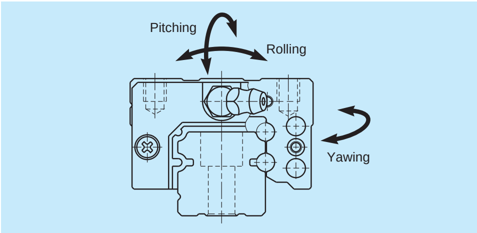

Fig. 3.5 Moment rigidity

• Since two rails and four slides are used in general as a pair, considering only the radial rigidity is sufficient.
• However, in cases as shown in Fig. 3.6, Fig. 3.7 and Fig. 3.8, it is necessary to take into account the moment rigidity in addition to the radial rigidity.

(3) Selection of preload types

• Several types of preload that match the characteristic of each series are set for NSK linear guides.
• Types of preload classification for each series are shown in Table 3.1. Table 3.2 shows the selection criterion of preload classification.

Table 3.1 Classification of preload in each series

Table 3.2 Loads

Classification of preload	Use condition	Applications
Z0, ZT, ZS (Fine clearance)	• An application in which a set of parallel two linear guides (four ball slides/two rails) is used to sustain a unidirectional load with low vibration and impact. • Application in which the accuracy is not very necessary but a friction force must be minimized.	Welding machine, Glass processing machine, Packaging/packing machines, Materials handling
Z1, ZZ (Slight preload)	• Moment loads are applied. • Application for highly accurate.	Industrial robot , Inspection/measuring equipment, Laser cutting machine, Electric discharge machine, PCB driller , Mounter
Z3, Z4 (Medium preload, Heavy preload)	• Application in which extremely high stiffness is essential. • Application in which vibration and impact load will be applied.	Machining centers, Lathes, Milling machines, Boring machines, Grinders

(4) Deformation Calculation

The followings are the relation between load and deformation.

• Without preload
When the rolling element is ball
The deformation is proportional to the 2/3 power of the load.
When the rolling element is roller
The deformation is proportional to the 9/10 power of the load.
• With preload
The deformation is directly proportional to the load.

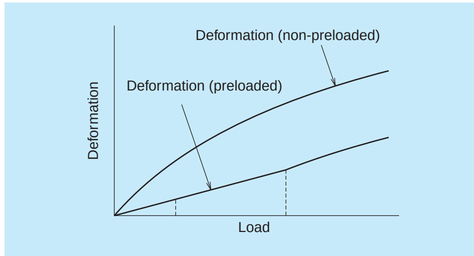

Fig. 3.9 Elastic deformation

A preloaded linear guide deforms proportionally to the load as shown in Figure 3.9; the calculation of system deformation can be done using the stiffness of slide. The factors required an estimation of system deformation are listed below. The stiffness is shown on the relevant explanation of each series.

<Required conditions to calculate deformation>
• Volume of load
• Direction of load
• Point of load application
• Position of deformation calculation
• Arrangement of rail and ball slides
• Position of driving mechanism

Please refer to the calculating formula of deformation for typical table structures on the Pages A18 to A20.

(5) Application examples of preload

Table 3.3 shows examples of preload of NSK linear guides for specific purposes.
Refer to this table when selecting preload type for your application.

(6) Load and rating life when the preload is taken into account

It is necessary to consider preload for calculation of rating life, when the Z3 (medium preload) or the Z4 (heavy preload) preload code is specified. Please consult NSK.

(7) Calculating Friction Force by Preload

- Dynamic friction force per one slide of the ball guide can be calculated from preload value.
- The following is a simple calculation to obtain the criterion of dynamic friction force.
  For slight preload ZZ of random-matching type with preload, use preload volume of slight preload Z1 of preloaded assembly.

$F = iP$

F : Dynamic friction force (N)
P : Preload (N)
i : Contact coefficient

Use the following contact coefficient values (i).

SH, SS, LH, LS, LW, HS Series : 0.004
HA, LA Series : 0.010
PU, PE, LU, LE Series : 0.026

- The starting friction force when the slide begins to move depends on lubrication condition. Roughly estimate it at 1.5 to 2 times of the dynamic friction obtained by the above method.

Calculation example

In case of LH35AN - Z3

$i = 0.004$
$P = 2350$ (N) (refer to LH series preload)
$F = iP$
$= 0.004 \times 2350 = 9.4$ (N)

Therefore, the criteria of the dynamic friction force of LH35AN - Z3 is 9.4 N.

For seal friction, refer to seal friction of each Series.

A-3-4 Accuracy

(1) Accuracy standard

The accuracy characteristics of linear guide are specified to each series in the variations of assembled height, assembled width, and running parallelism. We also specify the mutual variation of a pair of linear guides in the assembled height and assembled width. The accuracy of the table equipped with a set of linear guides is depending on other accuracies and many factors besides the accuracy of linear guides. Those are the accuracy of the mounting surface of the machine, the mounting span between two linear guides, the span of ball slides, the number of ball slides, and the location of the point at where the accuracy is really required.

(2) Definition of Accuracy

- Table 4.1, Figure 4.1 and Figure 4.2 show accuracy characteristics.

Table 4.1 Definition of accuracy

Characteristics	Definition (Figures 4.1 and 4.2)
Mounting height H	Distance from A (rail bottom datum face) to C (slide top face)
Variation of H	Variation of H in slides assembled to the rails of a set of linear guides
Mounting width W_2 or W_3	Distance from B (rail side datum face) to D (slide side datum face). Applicable only to the reference linear guide.
Variation of W_2 or W_3	Difference of the width (W_2 or W_3) between the assembled slides which are installed in the same rail. Applicable only to the reference linear guide.
Running parallelism of slide, face C to face A	Variation of C (slide top face) to A (rail bottom datum face) when slide is moving.
Running parallelism of slide, face D to face B	Variation of D (slide side datum face) to B (rail side datum face) when a slide is moving.

Running Parallelism of Ball Slide

- Running parallelism of slide is common in all series. Specifications of all accuracy grades are shown in Table 4.2. However, applicable accuracy grades differ by series. Please refer to "Table 4.4 Accuracy grade and applicable series" on page A35.

Note: Only "slight preload (Z1, ZZ)" and "fine clearance (Z0, ZT)" are available for "normal grade (PN and PC)".
For random-matching type, only accuracy grade "PC," and preload "ZZ" and "ZT" are available.
For random-matching RA Series, only accuracy grade "P6" and preload "Z3" are avialable.

(4) Combination of accuracy grade and preload

① Accuracy grades

- The accuracy grade which matches the characteristic of each series is set for NSK linear guides.
- Table 4.4 shows accuracy grade set for each series.
- Refer to "**(3) Application examples of accuracy grade**" which shows cases of appropriate accuracy grade for specific purpose.

Table 4.4 Accuracy grades and applicable series

② Preload

- Several types of preload that match the characteristic of each series are set for NSK linear guides.
- Types of preload for each series are shown in Table 4.5.
- Refer to characteristics of each series for details of radial clearance, preload, and rigidity.
- "**(3) Application examples of accuracy grade**" shows cases of appropriate preload and accuracy grades for specific purposes.

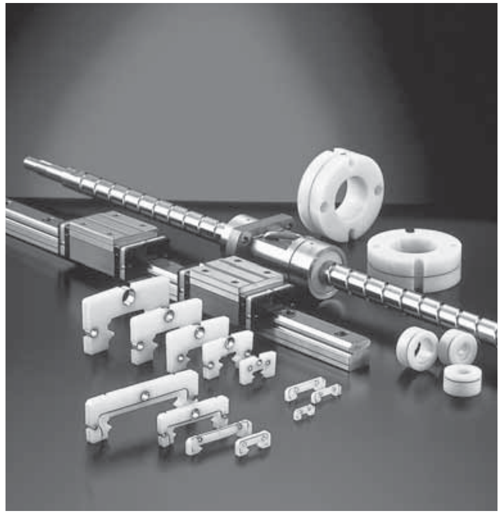
A-3-5 Lubrication

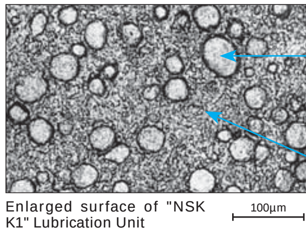
(1) NSK Linear Guides Equipped with "NSK K1™" Lubrication Unit.



"NSK K1™" lowers machine operation cost, and reduces impact on the environment.

What is "long-term, maintenance-free" operation?
Ball screws and linear guides which are equipped with "NSK K1™" do not require maintenance for five years or up to 10,000 km operational distance.

What is "NSK K1™" Lubrication Unit?
"NSK K1™" is a lubrication device which combines oil and resin in a single unit. The porous resin contains a large amount of lubrication oil. Equipped closely to the rail, "NSK K1™" constantly supplies fresh oil which seeps from the resin, lubricating the rail surface.



Enlarged surface of "NSK K1" Lubrication Unit

Polyolefin
Unlike vinyl chloride products, polyolefin does not produce dioxin. Polyolefin is also gaining use at supermarkets for food wrapping.

Lubrication oil
It is mineral oil-based. The oil has a viscosity of 100 cSt.

Remarkable capacity with new material: NSK K1™ Lubrication Unit information

- NSK K1 lubrication unit (referred to NSK K1 hereafter) to be equipped with NSK linear guide is outstanding new lubrication material.
- Newly developed "porous synthetic resin" contains large volume of lubricant oil, and it seeps out enhancing lubricating function.
- Simply install NSK K1 inside the standard end seal (rubber).
- We also provide NSK K1 lubrication unit for sanitary environments suited for food processing machinery, medical equipment and their ancillaries for the environment where hygiene control is essential. For details, refer to A-3-8 (3).

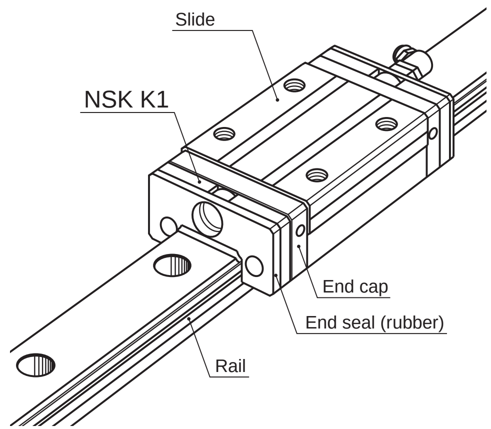


Fig. 5.1

1) Features

NSK K1 comprises a part of the compact and efficient lubrication unit.

① Maintenance is required only infrequently

Used with grease, and maintaining lubrication function for a long period of time. Ideal for systems/environments which make replenishment difficult.

▼

For automotive component processing lines, etc.

② Does not pollute the environment

A very small volume of grease combined with NSK K1 can provide sufficient lubrication in the environment where grease is undesirable as well as in the environment where high cleanliness is required.

▼

Food processing/medical equipment, liquid crystal display/semiconductor manufacturing equipment, etc.

We also provide NSK K1 lubrication unit for sanitary environment suited for food processing machinery, medical equipment and their ancillaries for the environment where hygiene control is essential. For details, refer to A-3-8 (3).

③ Good for environments where lubricant is washed away

Used with grease, life of the machine is prolonged even when the machine is washed entirely by water, or in an environment where the machine is exposed to rain or wind.

▼

Food processing equipment, housing/construction machines, etc.

④ Maintains efficiency in dusty environment

In environment where oil- and grease-absorbing dust is produced, long-term efficiency in lubrication and prevention from foreign inclusions are maintained by using the "NSK K1™" in combination with grease.

▼

Woodworking machines, etc.

*Stainless steel linear guides are available for use in corrosive environments or other environments where rusting is a potential problem.

2) Functions

NSK K1 has various superb functions. NSK's ample test data and field performances confirm NSK K1 abilities.

① Durability test at high speed, with no other lubrication

Figure 5.2 shows test results under these conditions. The linear guide operated with no lubricant is unable to travel after a short period because breakage occurs. Equipped with NSK K1, the linear guide easily travels 25000 km.

Conditions: Sample ; LH30AN (preload Z1)
Travel speed ; 200 m/min
Stroke ; 1800 mm
No lubricant: Completely degreased, no lubrication
NSK K1: Completely degreased, no lubrication + NSK K1

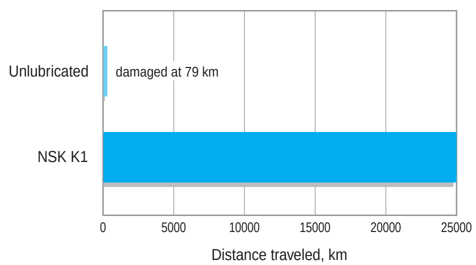

Fig. 5.2 Durability test at high speed, with no lubrication (lubricated by NSK K1 only)

② Durability test immersed in water

Figure 5.3 shows test results after the linear guide is immersed in water once per week for 24 hours at a time, then traveled for 2700 km. Without NSK K1, the ball groove sufrace wore out at an early stage and broke. With NSK K1, the wear was reduced to about 1/3 (Table 5.1). This test proves the effect of NSK K1.

Conditions: Sample ; LS30 Stainless (preload Z1)
Travel speed ; 24 m/min
Stroke ; 400 mm
Load ; 4700 N/Slide
Lubricant ; Fully packed with dedicated grease (*) for food machines
Immersing condition:

With NSK K1	16 – 18	2 – 3	6 – 8
Without NSK K1	30 – 45	9 – 11	17 – 25

④ Dust emission

Figure 5.5 is a comparison of NSK K1 dust emissions. The combination of NSK K1 and NSK Clean Grease LG2 (low dust grease) generates as little dust as fluorine grease.

Conditions: Sample ; LS20
Travel speed ; 36 m/min

③ Durability test with wood chips

Wood chips absorb lubricant. Maintaining lubrication in such environment is extremely difficult. Figure 5.4 shows that the life when NSK K1 is added to a standard seal is two times longer than the life when two seals are combined (Standard double seal).

Conditions: Sample ; LH30AN (preload Z1)
Travel speed ; 24 m/min

3) Specifications

① Applicable series and sizes

1 Can be installed in SH, SS, LH, LS, LW, RA, LA, PU, PE, LU, LE, HA, and HS series. For VH and TS series, NSK K1 is equipped as a standard specification.

2 Can be used with stainless steel materials and surface-treated items.

② Standard specifications

1 Install NSK K1 between the end seal and end cap. For TS series, it is installed inside end cap. (Double-seal specification, and specification with protector are also available on request.)

2 NSK standard grease is packed inside the slide. (Volume of grease, type of grease on request.)

3 Accuracy and preload are the same as standard items. (Dynamic friction increases slightly due to NSK K1.)

③ Number of installed NSK K1

Normally, one NSK K1 should be installed on both sides of slides. (two K1s for one slide)

However, more NSK K1 may be required under more stringent drive and environment. Please consult NSK for details.

Precautions for handling

To extend high functions of NSK K1, please observe the following precautions.

1. Temperature range for use: Maximum temperature for use: 50°C
   Momentary maximum temperature in use: 80°C

2. Chemicals that should not come to contact with NSK K1:
   Do not leave NSK K1 in organic solvent, white kerosene such as hexane, thinner which removes oil, and rust preventive oil which contains white kerosene.

Note: Water-type cutting oil, oil-type cutting oil, grease such as mineral-type AS2 and ester-type PS2 do not damage NSK K1.

(2) Lubrication

There are two types of lubricating method, grease and oil, for linear guides.
Use a lubricant agent and method most suitable to condition requirements and purpose to optimize functions of linear guides.
In general, lubricants with low base oil kinematic viscosity are used for high speed operation, in which thermal expansion has large impact, and in low temperatures.
Lubrication with high base oil kinematic viscosity is used for oscillating operations, low speed and high temperature.
The following are lubrication methods by grease and by oil.

1) Grease Lubrication

Grease lubrication is widely used because it does not require special oil supply system or piping. Grease lubricants made by NSK are:

- Various types of grease in bellowed container which can be instantly attached to the grease pump;
- NSK Grease Unit which comprise a hand grease pump and various nozzles. They are compact and easy to use.

1. NSK grease lubricants

Table 5.2 shows the marketed general grease widely used for linear guides, in specific uses, conditions and purposes.

Table 5.2 Grease lubricant for linear guides

① NSK Grease AS2

● Features

It is an environmentally friendly and widely used grease for high load application. It is mineral oil based grease containing lithium thickener and several additives. It is superb in load resistance as well as stability in oxidization. It not only maintains good lubrication over a long period of time, but also demonstrates superb capability in retaining water. Even containing a large amount of water, it does not lose grease when it is softened.

● Application

It is a standard grease for general NSK linear guides. It is prevalently used in many applications because of its high base oil viscosity, high load resistance, and stability in oxidization.

● Nature

Thickener	Lithium soap base
Base oil	Mineral oil
Consistency	275

Volume of evaporation	0.24% (99°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	2.8% (100°C, 24 hr)
Base oil kinematic viscosity	130 mm^2/s (40°C)

② NSK Grease PS2

● Features

The major base oil component is synthetic oil with mineral oil. It is an excellent lubrication especially for low temperature operation. It is for high speed and light load.

● Application

It is a standard grease for NSK miniature linear guides. It is especially superb for low temperature operation, but also functions well in normal temperatures, making it ideal for small equipment with light load.

● Nature

Thickener	Lithium soap base
Base oil	Synthetic oil + mineral oil
Consistency	275
Dropping point	190°C
Volume of evaporation	0.60% (99°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	3.6% (100°C, 24 hr)
Base oil kinematic viscosity	15 mm^2/s (40°C)

③ NSK Grease LG2

● Features

This grease was developed by NSK to be exclusively used for linear guides in clean room. Compared to the fluorine grease which are commonly used in clean room, LG2 has several advantages such as:

- Higher in lubrication function
- Longer lubrication life
- More stable torque (resistant to wear)
- Higher rust prevention.

In dust generation, LG2 is more than equal to fluorine grease in keeping dust volume low. Since the base oil is not a special oil but a mineral oil, LG2 can be handled in the same manner as general greases.

● Application

LG2 is a lubrication grease for linear guides for semiconductor and liquid crystal display (LCD) processing equipment which require a highly clean environment. Because LG2 is exclusively for a clean environment at normal temperatures, however, it cannot be used in a vacuum environment.

Refer to "Special environment" in Page A60 for detailed data on superb characteristics of NSK Grease LG2.

● Nature

Thickener	Lithium soap base
Base oil	Mineral oil + Synthetic hydrocarbon oil
Consistency	207
Dropping point	200°C
Volume of evaporation	1.40% (99°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	0.8% (100°C, 24 hr)
Base oil kinematic viscosity	30 mm^2/s (40°C)

④ NSK Grease LGU

● Features

This is a proprietary urea base grease of NSK featuring low dust emission exclusively for linear guides which are used in clean rooms.

In comparison with fluorine base grease, which has been used commonly in clean rooms, LGU has better lubricating property, longer duration of lubricant, better torque variation, much better anti-rust property, and equivalent or better dust emission. In addition, this grease can be handled in the same way as the other common grease because high-grade synthetic oil is used as the base oil.

LGU grease contains much less metallic elements compared to LG2 grease. It can be used in high temperature environment.

● Application

This is exclusive lubrication grease for linear guides that are installed in equipment that requires cleanliness, as same as LG2 grease, and it can be used in high temperature range of –30° to 180°C.

This cannot be used in vacuum.

● Nature

Thickener	Diurea
Base oil	Synthetic hydrocarbon oil
Consistency	209
Dropping point	260°C
Volume of evaporation	0.09% (99°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	0.6% (100°C, 24 hr)
Base oil kinematic viscosity	100 mm^2/s (40°C)

⑤ NSK Grease NF2

● Features

It uses high-grade synthetic oil as the base oil and urea base organic compound as the thickener. It has remarkable anti-fretting corrosion property. It can be used in wide temperature range, from low to high, and has superior lubrication life.

● Application

This grease is suitable for linear guides of which application include oscillating operations. Allowable temperature range is –40° to 130°C.

● Nature

Thickener	Diurea
Base oil	Synthetic hydrocarbon oil
Consistency	288
Dropping point	269°C
Volume of evaporation	7.9% (177°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	0.6% (100°C, 24 hr)
Base oil kinematic viscosity	27 mm^2/s (40°C)

● Precautions for handling

- Wash the linear guides to remove oil prior to applying Clean Grease LG2 or LGU, so the grease functions are fully utilized.
- Clean grease is exclusively used for clean environments at normal pressure.

2. How to replenish grease

Use grease fitting to linear guide slide if exclusive grease supply component is not used. Supply required amount to grease fitting by a grease gun (pump).
Wipe off old grease and accumulated dust before supplying new grease. If grease fitting is not used, apply grease directly to the rail. Remove the seal if possible, and move a slide few strokes so the grease permeates into the slide. A hand grease pump, an exclusive and easy lubrication device to linear guides, is available at NSK.

3. Volume of grease to be replenished

Once grease is replenished, another supply is not required for a long period of time. But under some operational conditions, it is necessary to periodically replenish grease. The following are replenishing methods.
• When there is an exclusive grease supply system and the volume from the spout can be controlled, the criterion is:
All at once, replenish the amount which fills about 50% of the internal space of the slide. This method eliminates waste of grease, and is efficient.
Page A46 shows internal spaces of slide of each series for refenence.
• When replenishing using a grease gun:
Use a grease gun and fill the inside of slide with grease. Supply grease until it comes out from the slide area. Move the slide by hand while filling them with grease, so the grease permeates all areas. Do not operate the machine immediately after replenishing. Always try the system a few times to spread the grease throughout the system and to remove excess grease from inside. Trial operations are necessary because the resistance to sliding force of linear guide greatly increase immediately after replenishment (full-pack state) and may cause problems. Grease's agitating resistance is accountable for this phenomenon. Wipe off excess grease that accumulates at the end of the rail after trial runs, so the grease does not scatter to other areas.

4. Intervals of checks and replenishments

Although the grease is of high quality, it gradually deteriorates and its lubrication function diminishes. Also, the grease in the slide is gradually removed by stroke movement. In some environments, the grease becomes dirty, and foreign objects may enter. New grease should be replenished depending on frequency of use. The following is a guide of intervals of grease replenishments to linear guides.

Table 5.3 Intervals of checks and replenishments for grease lubrication

Intervals of checks	Items to check	Intervals of replenishments
3-6 months	Dirt, foreign matters such as cutting chip	Usually once per year. Every 3000 km for material handling system which travels more than 3000 km per year. Replenish if checking results warrant it necessary.

Note: 1) As a general rule, do not mix greases of different brands. Grease structure may be destroyed if greases of different thickeners are mixed. Even when greases have the same thickener, different additives in them may have an adverse effect on each other.

2) Grease viscosity varies by temperature. Viscosity is particular high in winter due to low temperature. Pay attention to increase in linear guide's sliding resistance in such occasion.

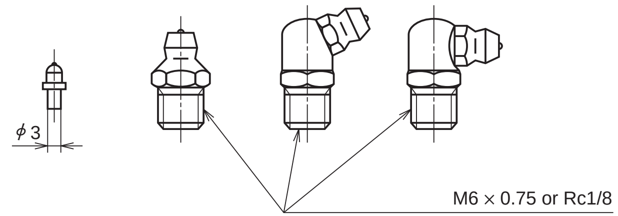

Fig. 5.8 Grease fittings

A long threaded grease fitting is required because of dust proof parts. Please refer to the sections pertaining to the lubrication and dust proof parts of each series.

2) Oil Lubrication

Required amount of new oil is regularly supplied by:

- Manual or automatic intermittent supply system;
- Oil mist lubricating system via piping.

Equipment for oil lubrication is more costly than one for grease lubrication. However, oil mist lubricating system supplies air as well as oil, raising the inner pressure of the slide. This prevents foreign matters from entering, and the air cools the system. Use an oil of high atomizing rate such as ISO VG 32-68 for the oil mist lubrication system.

ISO VG 68-220 are recommended for common intermittent replenishment system. Approximate volume of oil Q for a slide of linear guide per hour can be obtained by the following formula.

In case of ball type linear guide except for LA series

$Q \geq n/150$ (cm^3/hr)

In case of LA and RA series

$Q \geq n/100$ (cm^3/hr)

n: Linear guide code

e.g. When LH45 is used,

$n = 45$,

Therefore,

$Q = 45/150 = 0.3$ cm^3/hr

For oil lubrication by gravity drip, the oil supply position and installation position of the slide are crucial. In case of linear guide, unless it is installed to a horizontal position, the oil flows only on the down side, and does not spread to all race way surface. This may cause insufficient lubrication. Please consult NSK to correct such situations prior to use. NSK has internal design which allows oil lubricant to flow throughout the system.

Table 5.7 shows the criterion of intervals of oil checks and replenishments.

Table 5.7 Intervals of checks and replenishments

Method	Intervals of checks	Items to check	Replenishment or intervals of changes
Automatic intermittent supply	Weekly	Volume of oil, dirt, etc.	Replenish at each check. Suitable volume for tank capacity.
Oil bath	Daily before operation	Oil surface	Make a suitable criterion based on consumption

Note: 1) As with grease lubrication, do not mix oil lubricant with different types.

2) Some components of the linear guide are made of plastic. Avoid using an oil that adversely affects synthetic resin.

3) When using oil mist lubricating system, please confirm an oil supply amount at the each outlet port.

A-3-6 Dust Proof

(1) Standard Specification

- To keep foreign matters from entering inside the slide, NSK linear guide has an end seal on both ends, an bottom seal at the bottom, and an inner seal inside the slide.
- Table 6.1 shows seals for standard specification for each series.
- Seal friction per standard slide is shown in the dust proof item of each series.

(2) Dust proof components

• NSK has the following items. Select a suitable type for the operating environment.

Table 6.2 Optional dust proof components

Name	Purpose	Reference page
NSK K1 lubrication unit	Made of oil impregnated resin. Enhances lubricating functions.	A38 – 41
Double seal	Combines two end seals, enhancing sealing function.	A53
Protector	Protect end seal from hot and hard contamination.	A54
Rail cap	Prevents foreign matters such as swarf generated in cutting operation from clogging the rail-mounting hole.	A54
Inner seal	Installed inside a slide, and prevents foreign matters from entering the rolling contact surface.	A55
Bellows	Covers linear guide.	A55
Rail cover *)	Covers top of rail, and prevents foreign matters such as cutting dust from collecting in the rail mounting holes.	A258

*) Rail cover is applicable to RA25 to 65 of RA series.

1. Double seal

• A combination of two end seals to enhance seal function.

• When a double seal is installed, the end seal section becomes thicker than the standard item. Please pay attention to the increase in a slide length when designing the mounting dimension of slide and the table stroke. Please refer to the section of dust proof components for the dimensional increase in the length direction of each series due to fitting of double seal.

• Double-seal set: Can be installed to a completed standard item later on request. It comprises two end seals, a collar, and a screw for installation (Fig. 6.2). The product reference numbers of each series are described on the section of dust proof parts.

• When attaching a grease fitting to the end cap after the double seal is equipped, you require a connector shown in Figure 6.2. Please specify the connector set when ordering linear guides.

• For VH, RA, LA, HA, and HS Series, double-seal set can be installed only before shipping from the factory.

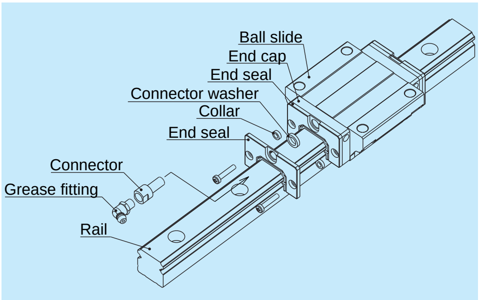

Fig. 6.2 Double seal

2. Protector

• A protector is usually installed outside the end seal to prevent high-temperature fine particles such as welding spatter and other hard foreign matters from entering the slide.

• Same as the case with a double seal, when a protector is installed, the slide becomes longer. Please pay attention to the increase in a slide length when designing the mounting dimensions of slide and the table stroke. The dimensional increase in the slide length because of protector is described on the section of dust proof components.

• Protector can be installed to a completed item later. The reference number for order shown in dust proof components of each series.

• When attaching a grease fitting to the end cap after the protector is equipped, you require a connector shown in Figure 6.3. Please specify the connector set when ordering linear guides.

• For VH, RA, LA, HA, and HS Series, protector can be installed only before shipping from the factory.

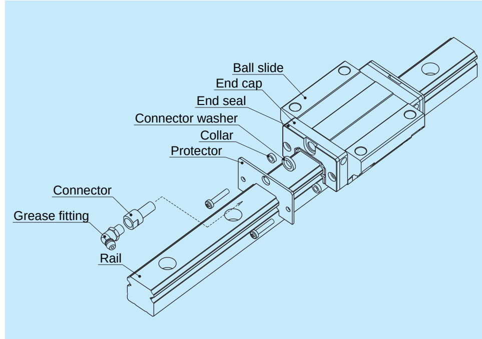

Fig. 6.3 Protector

3. Cap to cover the bolt hole for rail mounting

• After the rail is mounted to the machine base, a cap is used to cover the bolt hole to prevent foreign matters from clogging up the hole or from entering into the slide (Fig. 6.4).

• The cap for the bolt hole is made of synthetic resin which is superb in its resistance to oil and wear.

• The size of rail mounting bolts and bolt hole caps are shown on the section of dust proof components in each series.

• To insert a cap into the rail bolt hole, use a flat tool (Fig. 6.5). Pound the cap gradually until its height becomes flush with the rail top face.

• You can reorder extra bolt hole caps. The size of rail mounting bolts and reference numbers of bolt hole caps are shown on the section of dust proof components.

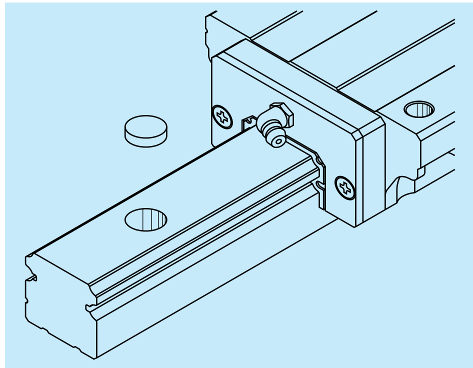

Fig. 6.4

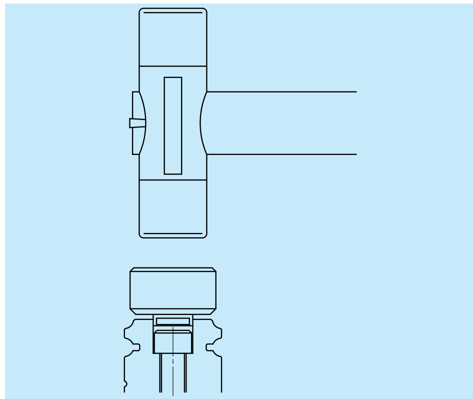

Fig. 6.5

4. Inner seal

- The end seal installed on both ends of the slide cannot arrest entire foreign matters, though the missed amount is negligible. An inner seal protects the rolling contact surface from such foreign matters which entered inside the slide (Fig. 6.6).
- Inner seal is installed inside the slide. Therefore, the appearance in size and the shape are the same as standard slide. (Inner seal is already installed before shipped from the factory.)
- It is strongly recommended to use a bellows and a double seal, along with an inner seal, to maintain precision of the linear guide.
- Refer to Table 6.1 for availability of inner seal.

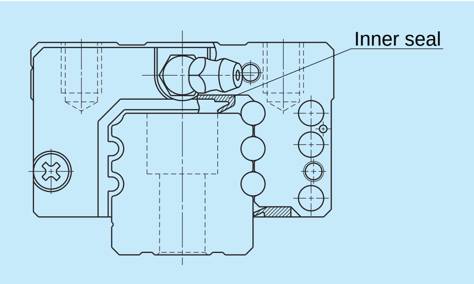

Fig. 6.6 Inner seal when installed

5. Bellows

- Bellows covers entire linear guide. It has been used widely as a way of protection in an environment where foreign matters are prevalent.
- NSK has bellows exclusively for LH (SH), LS (SS), LA and LW Series. They have a middle bellows and a bellows at both ends. For LH Series, there are low and high type bellows which are in compliance with their slide types.
- The high type is used for AN and BN types. The low type is used for FL, EL, EM, HL, GL, GM, AL and BL types. By combining, the top of the bellows is slightly lower than the top face of the slide.
- When a high type bellows is installed to the slide with the height code L (such as FL), the top of the bellows becomes higher than the slide. However, it is advantageous for stroke because the pitch of the bellows becomes larger.
- Special bellows are required for installing the linear guide vertically, or hanging it from a ceiling. Please consult NSK.
- When a bellows is used, please be advised that we cannot put a grease fitting on the end of slide to which the bellows is attached. If you require the grease fitting, it shall be put on the side of end cap or slide body. Consult NSK for details.
- For the dimension of bellows, please refer to the section of dust proof parts of each series.

① Installation of bellows SH, SS, LH and LS Series

*** Installation in the ball slide (Fig. 6.7)**

- Remove two machine screws (M_2) which secure the end seals to the end of the slide (Fig. 6.7). For LS15, hold the end cap by hand. Otherwise, the end cap is detached from the ball slide, and the balls inside may spill out.
- Then place a spacer to the hole for securing end seal. Fasten the mounting plate at the end of the bellows to the slide with a slightly longer machine screw (provided with the bellows).

*** Installation in the rail**

- To install bellows for SH, SS, LH and LS Series, lightly knock a fastener exclusively for bellows to the end of the rail (Fig. 6.7). Then secure the mounting plate at the end of the bellows through the tap hole of the fastener.
- As described above, a bellows can be easily installed in the end of the rail without creating a tap hole on the end of the rail.

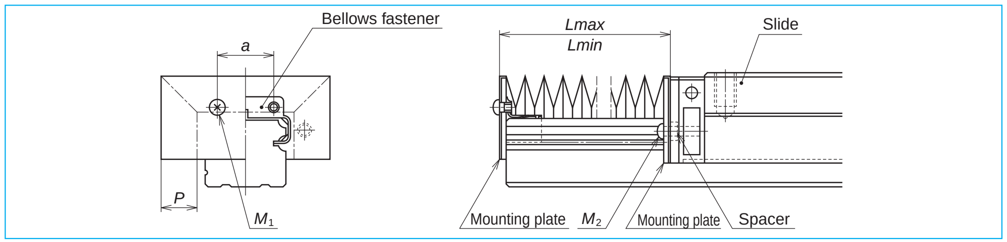

Fig. 6.7

② LA and LW Series

*** Installation in the ball slide (Fig. 6.8 and Fig. 6.9)**

- Remove two machine screws which secure the end seal. (For LW17 and 21, hold the end cap by hand. Otherwise, the end cap is detached from the slide, and the balls inside may spill out.)
- Place a spacer in the securing hole of the end seal, fasten the mounting plate on the end of the bellows using a slightly longer machine screw (provided with the bellows).

*** Installation in the rail**

- Make tap holes to the rail end face. Fix the bellows mounting plate to the rail end face through these tap holes. Use a machine screw. NSK processes a tap hole to the rail end face when ordered with a linear guide.

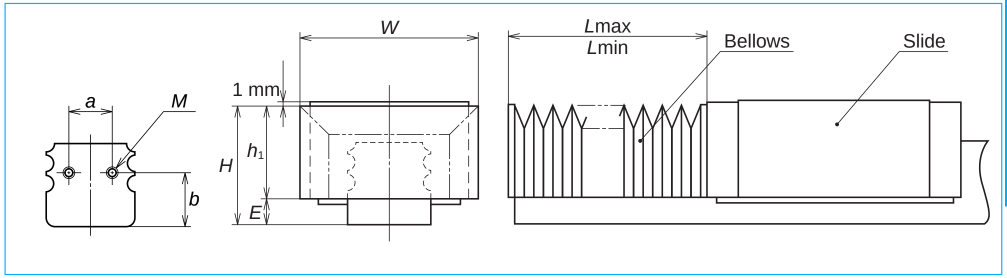

Fig. 6.8

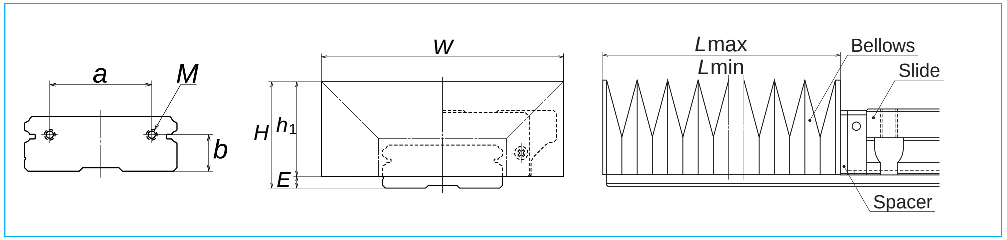

Fig. 6.9

Calculating length of bellows

- Formula is as follows.
- A bellows forms one block (BL) with six folds as shown in Fig. 6.10. Stroke is determined by multiplying by an integer of this BL.
- Length when stretched to maximum size :

Lmax = 7 × P × Number of BL

- Length when contracted to minimum size :

Lmin = 17 × Number of BL

- Stroke : **St = Lmax – Lmin**
- P and the number of BL are shown in bellows dimension table in each series.

(2) Surface Treatment

1) Recommended surface treatment

Among the surface treatments mentioned above, we recommend "low temperature chrome plating" and "fluoride low temperature chrome plating" for rust prevention because of the result of humidity chamber test for antirust characteristics and their cost-effectiveness.
However, never apply any organic solvent for degreasing because it has adverse effect on antirust characteristics.
Refer to next page for the results of humidity chamber test.
Please consult NSK for other surface treatment.

○Low temperature chrome plating (Electrolytic rust prevention black treatment)

- Used to prevent corrosion, light reflection, and for cosmetic purpose.

○Fluoride low temperature chrome plating

- Fluoroplastic coating is provided following the low temperature chrome plating.
- Resistance to corrosion is higher than electrolytic rust prevention film treatment.

2) Rust prevention of fluoride low temperature chrome plating

The use environment of NSK linear guides is expanding from general industrial machines, semiconductor and liquid crystal manufacturing systems to aerospace equipment.
Among all measures to cope with environment, rust prevention is the most challenging. Such environment includes: Moisture for washers and other equipment; Chemicals used in the wet processing of semiconductor and liquid crystal display manufacturing equipment.
NSK developed electrolytic rust prevention black film treatment (black chrome plating) which is added by fluororesin impregnating treatment. (hereinafter referred as "Fluoride low temperature chrome plating") This surface treatment methods has proved its superiority as the rust prevention of linear guides which are used in above equipment.

● What is "Fluoride low temperature chrome plating ?"

This is a type of black chrome plating which forms a black film (1–2 µm) on the metal surface. Fluoroplastic coating is added to the film to increase corrosion resistance.

- Accuracy control is easily manageable due to low temperature treatment and to an absence of hydrogen embrittlement.
- Product accuracy is less affected due to the thin film which has high corrosion resistance.
- This method is superior to other surface treatments in durability on the rolling surface.
- Inexpensive compared with products by other surface treatment and stainless steel products.

Do not use organic solvent because it adversely affects antirust property of the plating.

A-3-8 Special Environment

(1) Heat-Resistant Specifications

- Standard linear guides use plastic for rolling element recirculation component. The environmental maximum temperature of standard linear guides is 80°C.
- Use linear guide with heat-resistant specifications under temperatures that exceed this limit.

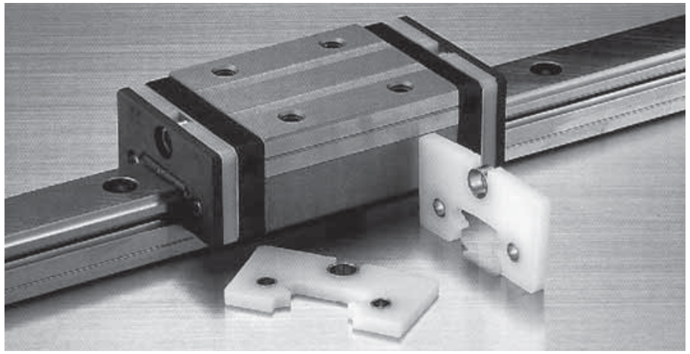
(2) Vacuum and Clean Specifications

- Due to its abundant experience and technology, NSK manufactures linear guides that can be used in a vacuum or in clean environment. Please consult NSK.
- Linear guide specifications vary for environmental conditions.
  For example, "all stainless steel plus special grease, or solid film lubricant" for vacuum environment.
- NSK has low-dust generating grease "**LG2**" which is ideal for clean environment.
  Refer to Page A43 for details.

(3) "NSK Linear Guides for Food Processing Equipment and Medical Devices" for Sanitary Environment

Used with NSK K1 for food processing equipment and medical devices and grease for food processing equipment.



What is "NSK K1™" for food processing equipment and medical devices?

With an amazing innovation lubrication unit, the "NSK K1™" for food processing equipment and medical devices utilizing the US Food and Drug Administration (FDA) compliant material, provides reliability when used in food processing equipment and medical devices. The newly developed porous synthetic resin contains abundant lubricant.

With the basic function of highly praised "NSK K1™" lubrication unit for general industry, more sophisticated materials make it applicable in food and medical equipment.

It also offers easy installation, mounted inside the standard end seal.

1. Features

◆The highest grade of category H1 grease of USDA standard is used for NSK K1 lubrication unit.

*category H1: Lubricants permitted for use where there is possibility of incidental fool contact

*USDA: USDA (The United States Department of Agriculture)

<Features of grease for food processing machines>

• This grease is approved by USDA H1. (National Science Foundation [NSF] carries out certification for USDA.)

• Superb water resistance and antirust capability

• Superb wear resistance

• Applicable for a centralized oiling system

◆Appropriate volume of grease

Reduces grease draining and scattering, and maintains a clean environment by supplying appropriate volume of grease.

Precautions for use

To maintain optimal performance of NSK K1 lubrication unit over a long time, please follow the instructions below:

1. Temperatures range for use: Maximum temperature for use: 50°C
   Momentary maximum temperature in use: 80°C
2. Chemicals that should not come to contact:
   Do not leave NSK K1 lubrication unit in organic solvent, white kerosene such as hexane, thinner which removes oil, and rust prevention oil which contains white kerosene.

Note: Water-type cutting oil, oil-type cutting oil, grease such as mineral-type and ester-type do not damage NSK K1 lubrication unit.

(5) Lubrication and Materials

1. Lubrication

Grease can be used for high rotation and magnetic field. However, grease evaporates or solidifies in special environment such as vacuum, high temperature, and low temperature. Solid lubricant is used when it is difficult to use grease. Functions of solid lubricant differ greatly by condition where it is used. It is important to select the most suitable solid lubrication for the environment.

2. Materials

Steel type metals are used in vacuum, high temperature, and high speed environments as the basic material. We generally use nonmagnetic stainless steel for nonmagnetic materials.

4. Precautions for Handling

Please observe the following precautions to maintain high functions of linear guide.

- Products are washed to remove oil, and wrapped in a way to protect them from moisture. Use the product as soon as possible after opening the package.
- After opening, store the products in a clean, air-tight container such as desiccater with desiccating agent (e.g. silica gel). Do not apply rust preventive oil or paper or product that vaporizes rust preventive agent.
- Wear plastic gloves and handle product in clean place.

Note: Please refer to the catalog "CAT. No. E1258 SPACEA" for details of special environmental use.

A-3-9 Arrangement and Mounting of Linear Guide

(1) Arrangement

- For NSK linear guide, the datum face of the rail and of the slide are marked with either a "datum face groove" or with an "arrow."
- In case that two or more linear guides are used together, one linear guide is designated as a reference side guide, and the rest is adjusting side guide(s). The reference side linear guide has its reference number, serial number, and "KL" mark on the opposite side of the datum face (Fig. 9.1).
- When the datum faces of the reference side rail and slides are pressed to their mounting datum faces respectively, the variation of distance (mounting width W_2 or W_3) between the datum faces of the rails and that of the slides must be a minimum and therefore, it is specified as the standard.
  (Fig. 9.2 and 9.3)
- The ways to indicate the datum faces of each series are shown in Table 9.1.

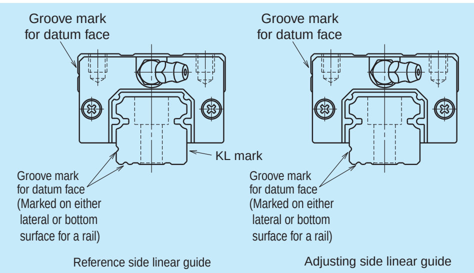

Fig. 9.1 Datum face

Example of arrangement

- Arrangement of the linear guide must be determined taking into account the table position, its direction (horizontal, vertical, inclined, hanging from the ceiling), stroke, the size of bed and the table in the equipment as a whole. Table 9.2 shows a common arrangement examples, and features/precautions for each case.

Table 9.2 Arrangement example

Arrangement	Features/Precautions
	• Easy in highly-accurate installation (recommended arrangement)
	• Easy in highly-accurate installation • Lubricant oil may not be supplied to slide. Precaution is required in the oil supply design.
	• Slightly difficult for highly-accurate installation • Life of linear guide is affected by mounting accuracy. • When oil lubricant is used, precaution is required in oil supply design.
	• Difficult for highly-accurate installation • For a linear guide mounted in sideways, precaution is required in oil supply design if oil lubricant is used.
	• Rather easy in highly-accurate installation • When oil lubricant is used, precaution is required in oil supply design.
	• Easy in highly-accurate installation if the linear guide is installed to the machine base first, then hung upside down along with the machine base. • Slide may detach from the rail and fall down if the linear guide is damaged and rolling element in the slide fall out. It is necessary to take preventive measures against the falling of the ball slide.

(2) Mounting Accuracy

1. Accuracy of the mounting base of machine

• Mounting accuracy of linear guide usually copies the accuracy of the machine base.

• However, when two or more slides are assembled to each rail, the table stroke becomes shorter than the mounting surface. This, along with the fact that the mounting error is evenly spread, contributes to a higher table accuracy than the mounting face accuracy, reducing the error to about 1/3 in average (Fig. 9.4).

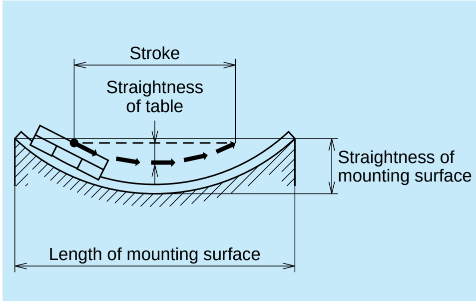

Fig. 9.4

2. Installation error

• Mounting error affects mainly three factors: life, friction and accuracy (Table 9.3).

Table 9.3 Influence of mounting error

Factor	Influence	
Life		• Large mounting error generates a force which twists the slide and reduces its life. • It also distorts the contact point of the ball and the groove, and changes contact angle, lowering rigidity.
Friction		• SH, SS, LH and LS Series are affected very little by mounting error thanks to their small friction. (self alignment) • However, because of off-set Gothic arch grooves, their friction suddenly soars once the mounting error exceeds a certain level. • Mounting error severely affects friction of LA Series with heavy preload.
Accuracy		• When rigidity of four slides are equal, the theoretical straightness becomes 1/2 of the installation error e_1. • However, this value becomes slightly larger due to deformation of the rail and the machine base.

3. Permissible values of mounting error

• Of the three factors; life, friction, and accuracy, which are affected by the mounting error, NSK focuses on life. By the NSK standard, permissible values of mounting error are the values under the following conditions.

For ball guide
- Load volume per ball slide is 10% of the basic dynamic load rating C.
- Rated life is 5000 km or longer.
- Rigidity of the machine base is infinite.

For roller guide
- Load volume per roller slide is 10% of the basic dynamic load rating C.
- Rated life is 10000 km or longer.
- Rigidity of the machine base is infinite.

• Fig. 9.5 and 9.6 are representing the mounting errors. Their permissible values of mounting error are shown in "Installation" of the each series.

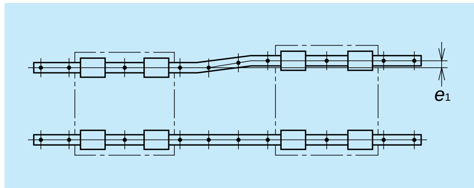

Fig. 9.5

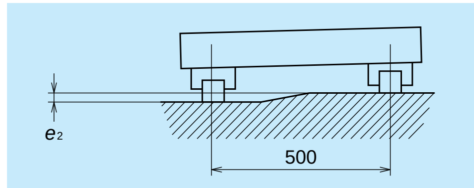

Fig. 9.6

4. Running accuracy and the influence of even-off effect

- When installed in a machine base, the linear guide is affected by the flatness of the mounting face of the machine base. However, in the case of two-rails/four-slides specification, which is most widely used, the straightness as a table unit is generally less than the straightness as a single component. This is due to the even-off effect generated by the shorter stroke, compared to rail length, as well as by interaction between the rails, and slides.
- Fig. 9.9 shows an actually measured straightness of the table which uses NSK linear guide. In this case, the final straightness of the table is about 1/5 of the straightness of the mounting face.

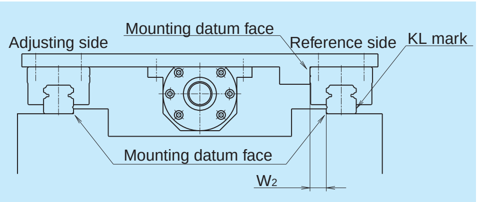

Fig. 9.7

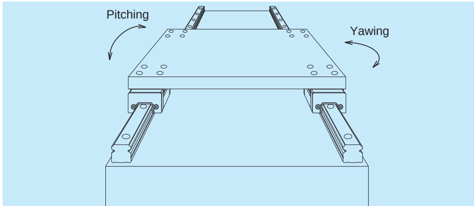

Fig. 9.8

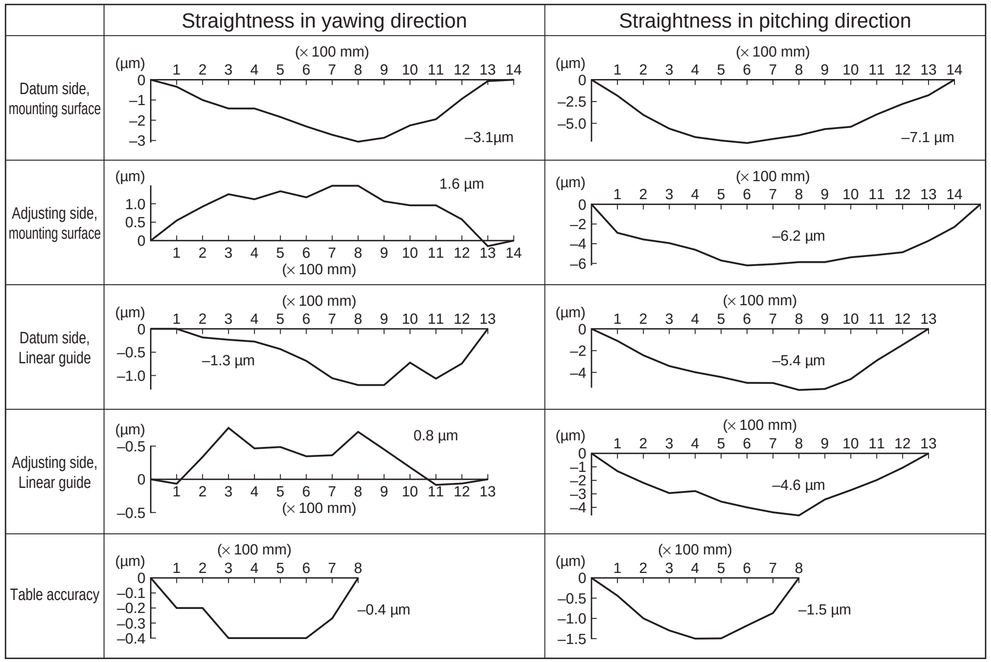

Fig. 9.9 Straightness of the table equipped with linear guide

(3) Installation

1. Shoulder height of the mounting face of the machine base and corner radius r

- Fig. 9.10 and 9.11, show shoulder height of the mounting face of the machine base and the size of corner r. These figures are relevant when the linear guide is pressed to the shoulder of the machine base or table (the raised section from where the mounting face begins), and horizontally secured to it. Recommended sizes are shown in "Shoulder hight and corner radius r" of each series introduction.
- The shoulder should be thick (wide) enough, so it is not deformed by the pressing force.

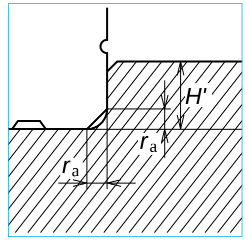

Fig. 9.10 Shoulder for the rail datum face

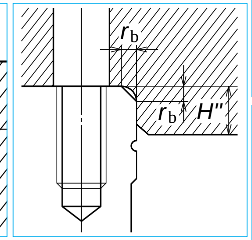

Fig. 9.11 Shoulder for the slide datum face

2. Tightening torque of the bolt

- Table 9.4 shows tightening torque of the bolt when the rail is secured to the fixture of race way interface grinding machine.
- Apply same torque in this table when securing the rail to the machine base. Equal accuracy at the time of grinding can be obtained.

Table 9.4 Bolt tightening torque (Bolt material: High carbon chromium steel)

M4	2.5	M16	196
M5	5.1	M18	265
M6	8.6	M22	520
M8	22	—	—

3. Installation procedures

- There are two installation ways depending on the accuracy requirement.
  - a. Installation with high accuracy
  - b. Accuracy is not high, but easy to install
- For both methods, wipe off the rust preventive oil applied to the linear guide. Remove burrs and small bumps on the machine base and table mounting face with an oilstone (Fig. 9.12).

  Apply machine oil or similar oil with low viscosity to the mounting face to increase the rust preventive effect.
- Linear guide is a precision product. Handle with care.

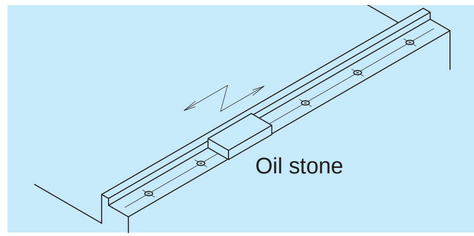

Fig. 9.12

A Highly accurate installation

ⓐ **Rail installation procedures**

ⓐ**-1) Machine base has a shoulder on the side where the reference side rail is installed.**

① Confirm that the rail is reference side rail, and the datum face of the rail comes face to face with the shoulder of the bed. Keep the slides on the rail, and carefully place the rail on the machine base on its mounting face. Temporarily tighten the bolts.
At this time, press the rail from sideways to make the rail tightly contact to the shoulder of the machine base. Apply tightening torque to the bolt in Table 9.4 when tightening a shoulder plate (Fig. 9.13).
Refer to "**4. Various methods to press linear guide sideways.**"

② For final tightening of the bolts to secure the rail, tighten the bolt on either end of the rail, then proceed to other end.
If the datum face is on the left side as shown in Fig. 9.14, tighten the bolt at the farthest end first, then proceed to near end.
This way, a bolt rotating force presses the rail against the shoulder. (Therefore, the rail is pressed sufficiently tight against the shoulder by merely pressing the rail by hand. However, if there is a possibility applying a lateral impact load, it is necessary to use a shoulder plate to prevent the rail from slipping.)

③ If the mounting face of the machine base where the adjusting side rail is installed also has a shoulder, repeat the steps ① - ②.

④ If there is no shoulder on the mounting face of the machine base for the adjusting side rail: Secure a measuring table to the slides of the reference side rail (Fig. 9.15). Use this to adjust the parallelism of the adjusting side rail. Check parallelism of the adjusting side rail with a dial gauge from one end of the rail, tightening the bolts one by one.
The measuring table is more stable if secured to two bearings, but one bearing is sufficient.
Parallelism between two rails can also be checked by the same method in Fig. 9.15 when there is a shoulder on the face where the adjusting side rail is installed.

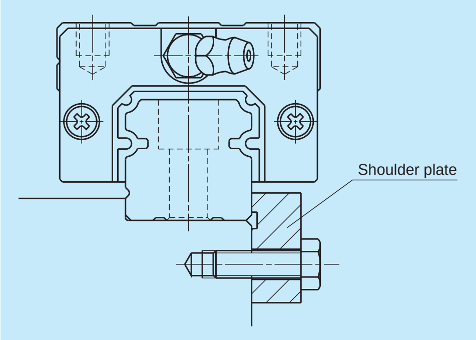

Fig. 9.13 Pressing the rail from sideways

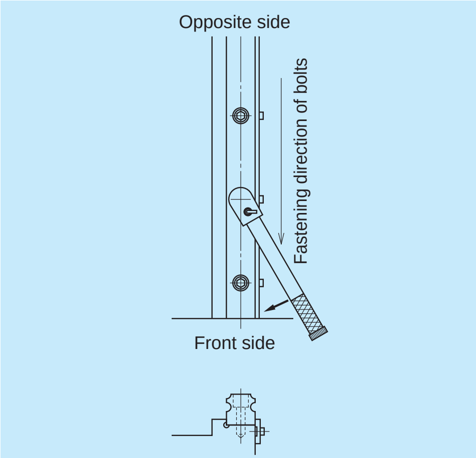

Fig. 9.14 Rail installation

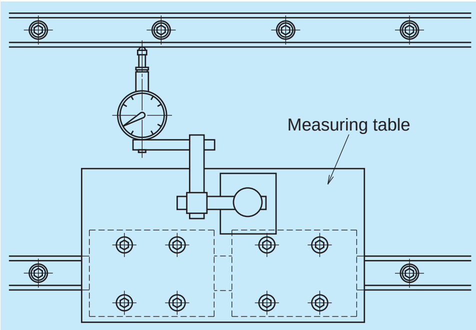

Fig. 9.15 Measuring parallelism

ⓐ**-2) When machine base does not have a shoulder on the side where the reference side rail is installed**

① Carefully place the reference side rail on the machine base on its mounting face. Temporarily tighten the bolts. Do not tighten the bolts all the way, but stop tightening when the bolt enters halfway into the bolt hole. This makes the proceeding steps easier.

② Place the straight edge almost parallel to the reference side rail which is temporarily secured by bolts. (At both ends of the rail and straight edge, the distance between them shall be almost same.)

③ Once the position of the straight edge is determined, use it as the reference. With a dial gauge, check parallelism with the rail, and adjust the rail if necessary. Then tighten the bolts.
Ensure that the straight edge does not move while the bolts are being tightened.
This procedure should be carried out starting from one end of the rail to the other end. (Fig. 9.16).

④ Finally tighten all bolts with specified torque.

⑤ There are two ways for installation of adjusting side rail:
1. Based on the straight edge which is used for reference side rail installation
2. Based on the reference side rail which is installed prior to the adjusting side rail.
In both cases, use a dial gauge to measure parallelism.
Other procedures are the same as ① - ④, and the ④ in cases where there is a shoulder on the machine base.

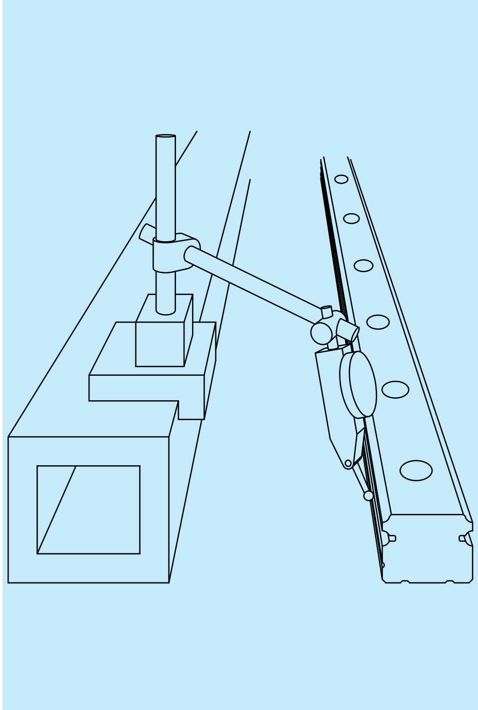

Fig. 9.16

ⓑ **Procedures of slide installation**

ⓑ**-1) When table has a shoulder**

① Arrange the slides so that locations match to their mounting section of the table. Carefully place the table on the slides. Temporarily tighten all bolts.

② While pressing the table from sideways, further tighten the bolts which secure the slides on the reference side, so the table shoulder and the slide's mounting datum face are sufficiently tightly pressed.
If a shoulder plate is provided, first tighten the bolts of the plate, then further tighten the bolts to the slides (Fig. 9.17).

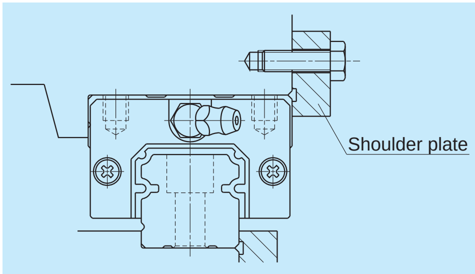

Fig. 9.17 Pressing slide from sideways

③ Then, further tighten the bolts for slides on the adjusting side rail.
Move the table by hand to confirm that there is no abnormality such as excessive friction force during stroking. (This confirms that the correct installation steps were taken.)
④ Finally, tighten all bolts with standard torque.

ⓑ-2) When table does not have a shoulder

① Arrange the slides so that locations match to their mounting section of the table. Carefully place the table on the slides. Temporarily tighten bolts to secure slides.
② Since the table does not have a shoulder, immediately tighten the bolts further to secure slides.
③ Move the table by hand to confirm that there is no abnormality. Finally, tighten all bolts with standard torque.

B Easy installation

① Carefully place the reference side rail on the machine base. Then tighten the bolts for installation with specified torque.
② Temporarily tighten the bolts on the adjusting side rail.
③ Tighten the slides on the reference side rail and one slide on the adjustment side rail with specified torque. Leave the rest of the slide on the adjusting side rail temporarily tightened (Fig. 9.18).
④ While moving the table with each pitch of the bolt for rail: With specified torque, tighten the rail mounting bolt which is located immediately adjacent to the slide on the adjusting side rail that had been finally tightened.
Take this procedure from one end to the other.
⑤ Return the table to the original position once. Then with standard torque, tighten the rest of the slides on the adjusting side. Then, by the same procedure as in ④, tighten the rest of the rail mounting bolts with standard torque. Move the table to check any abnormality such as large friction force.

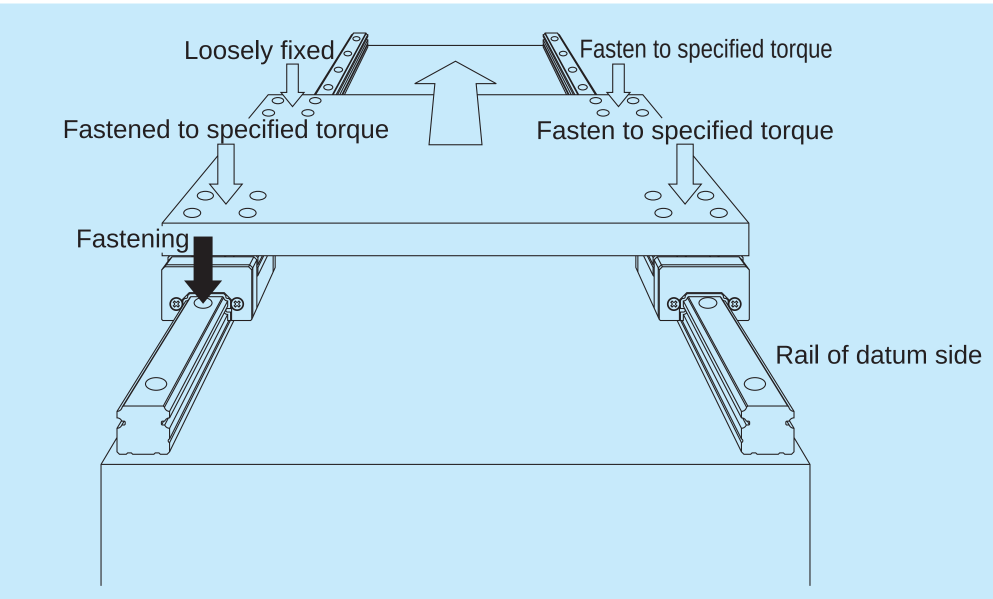

Fig. 9.18 Easy installation

4. Various methods to press linear guide sideways

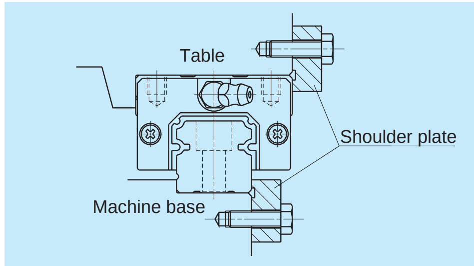

Fig. 9.19 Recommended method

• This method is most widely used, and generally recommended. The slide and the rail should protrude slightly from the sides of table and machine base. The shoulder plate should have a recess, so the corners of the rail and slide do not touch the shoulder plate.

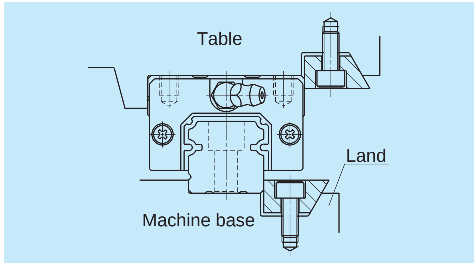

Fig. 9.20 Installation that requires caution

• A tapered block is squeezed in. However, the slightest tightening of the bolt generates a large pressing force to the side. Too much tightening may cause the rail to deform, or the land (shown in the figure left) to warp to the right. This method requires caution.

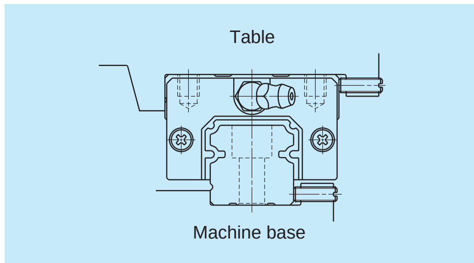

Fig. 9.21

• The bolt that presses rail must be thin due to limited space.

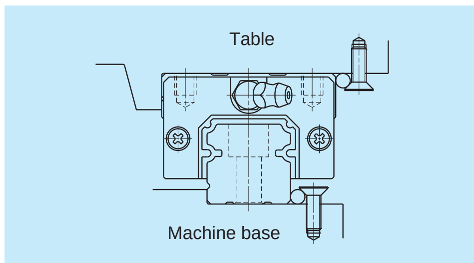

Fig. 9.22

• Press a needle-shape roller with a taper section of the head of a slotted pan head screw. Watch out for the position of the screw.

(4) Assemble Random-Matching Linear Guide

- Random-matching slide is assembled on a provisional rail (an inserting tool) when it is delivered (Fig. 9.23).
- NSK standard grease is packed into the slide, allowing immediate use.

Assembly procedures of random-matching linear guide

Follow steps as described below.

① Wipe off the rust preventive oil from the rail and slide.

② Please match an groove mark for datum face of slide and rail to become an assembling state desired.

③ Align the provisional rail to the rail in the bottom and side faces. Press the provisional rail lightly against the rail, and move the slide over the rail (Fig. 9.23).

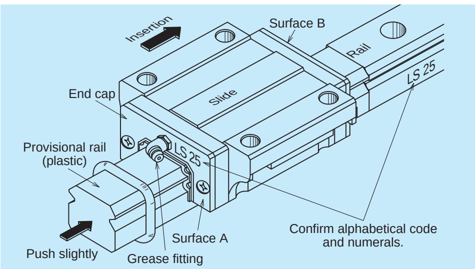

Fig. 9.23 Inserting slide into the rail

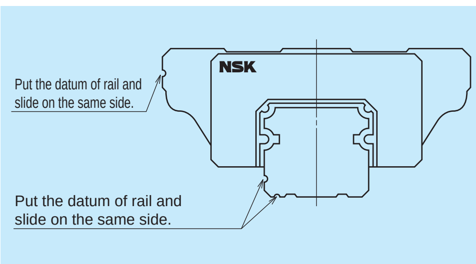

Fig. 9.24

(5) Butting Rail Specification

- A rail which requires the length that exceeds manufactured maximum length comes in butting specification.
- The rails with butting specification are marked with alphabet (A, B, C ...) and an arrow on the opposite side of the mounting datum face. Use the alphabets and arrows for assembly order and direction of the rail (Fig. 9.25).
  The random-matching rails for butting specification are only marked with the arrows.
- The pitch of the rail mounting hole on the butting section should be as F in Fig. 9.26. When two rails are used in parallel, the butted sections should not align. This is to avoid change in the running accuracy of the table at the butted sections.
- We recommend shifting the butting sections more than the length of a slide. If the higher running accuracy is required, consider installing the slides into the table so that they do not simultaneously pass the butting sections.

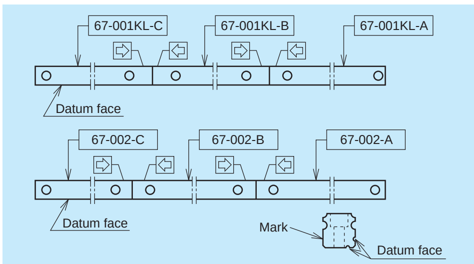

Fig. 9.25

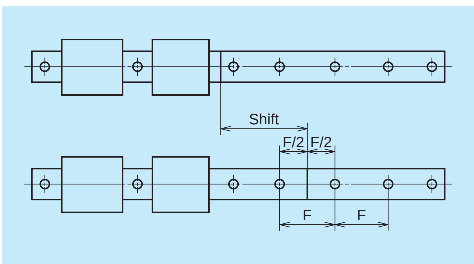

Fig. 9.26

(6) Handling Preloaded Assembly

- In case of the preloaded assembly (not random matching), do not remove slides from the rail as a general rule.
- If it is unavoidable to remove slides from the rail, make certain to use a provisional rail (a jig used to insert a slide to the rail) as shown in Fig. 9.27.
- Provisional rail for each model is in stock.
- Pay due attention to the assembly mark when returning the slide back to the rail. Follow the cautions described below.

Mark for assembling ball slide and rail

- Rails of preloaded assembly (not random-matching) are marked with a reference number and a serial number on the opposite of the datum face.
- Slide to be combined are also marked with the same serial number (reference number is not marked).
- Furthermore, slides are marked with an arrow. Slides should be positioned with their arrows facing each other.
- In case that the slides had to be removed from the rail, confirm their serial numbers and the directions of arrows for re-assembly (Fig. 9.28).
- When two or more rails are used in a single set, serial numbers are in sequence if their reference numbers are the same. The linear guide with smallest serial number has the "KL" mark (Fig. 9.29).
- When two or more rails of different reference number are used in a single set, the rails and slides have the same serial number. In this case, when slides are removed from the rail, it is unclear which rail each slide was previously installed on. When removing ball slides from the rail for an unavoidable reason (Fig. 9.30), sufficient precaution is required.

A-3-10 Drills to Select Linear Guide

(1) Single Axis Material Handling System

This section explains linear guide selection, life calculation, and deformation at load acting point for a single axis material handling system equipped with linear guide.

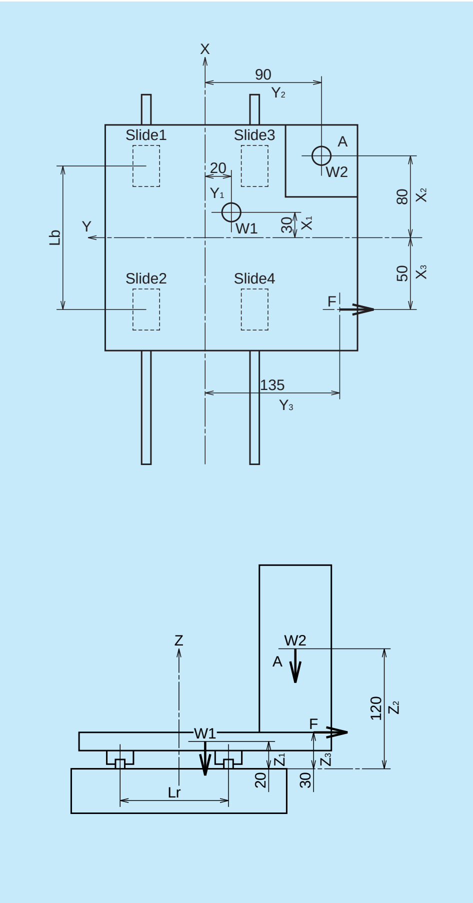

Fig. 10.1 Single axis material handling system

The work load is applied only to one way of stroke. Assume that the load is acting in full stroke as the condition of acting load is unknown.

Specification of single axis material handling system

Table weight W1 : 150 (N)
Weight of the work W2 : 200 (N)
Acting load F : 200 (N)

Ball slide span L_b : 100 (mm)
Rail span L_r : 90 (mm)

Load point coordinates from the table center (mm)

Load	X coordinate	Y coordinate	Z coordinate
W1	30	−20	20
W2	80	−90	120
F	−50	−135	30

Stroke: 1000 mm
(1 cycle: 2000 mm)

Environment : 10 – 30 (°C)
Travel speed : 12 (m/min)
Time to reach travel speed : 0.25 (sec)
Operating hour : 16 (hr/day)

(1)-1 Selection of linear guide model

Select a type of linear guide from **"A-1-2 Structure and Characteristics of Linear Guide."** Since this material handling system has 2 rails and 4 ball slides, **LH, LS, and LU Series** are suitable.

Here, we temporary select LU15 because of the dimensions of mounting space.

(1)-2 Calculating life

Calculate life of the selected LU15AL based on **"A-3-2 Rating Life and Basic Load Rating."**

Linear guide LU15AL

Basic dynamic load rating : 5550 (N)
Basic static load rating : 6600 (N)

Load conditions of the linear guide

Table weight W1 : 150 (N)
Weight of the work W2 : 200 (N)
Applied load F : 200 (N)
Rail span L_r : 90 (mm)
Ball slide span L_b : 100 (mm)

From the time to reach travel speed and the travel speed, the table acceleration is 0.8 m/sec^2. Therefore, it is not necessary to take into account inertial force brought about by table mass.

Calculation of the load applied to ball slide

Calculate two occasions:

1. There is the work mounted on the table.
2. No work mounted on the table.

From **Pattern 4** in Table 2.2 (page A19)

There is a work mounted on the table

Vertical direction loads

$$
\begin{aligned}
M1 &= \sum_{j=1}^{n}(F_{yj}\cdot Z_{yj}) + \sum_{k=1}^{n}(F_{zk}\cdot Y_{zk}) \\
&= F\cdot Z_3 + W1\cdot Y_1 + W2\cdot Y_2 \\
&= -200\times 30 + 150\times(-20) + 200\times(-90) \\
&= -27000\ (\mathrm{N\cdot mm})
\end{aligned}
$$

$$
\begin{aligned}
M2 &= \sum_{i=1}^{n}\{F_{xi}\cdot(Z_{xi}-Z_b)\} + \sum_{k=1}^{n}(F_{zk}\cdot X_{zk}) \\
&= W1\cdot X_1 + W2\cdot X_2 \\
&= 150\times 30 + 200\times 80 \\
&= 20500\ (\mathrm{N\cdot mm})
\end{aligned}
$$

$$
\begin{aligned}
F_{r1} &= \frac{\sum_{k=1}^{n}F_{zk}}{4} + \frac{M1}{2\cdot L} + \frac{M2}{2\cdot \ell} \\
&= \frac{W1+W2}{4} + \frac{M1}{2\cdot L_r} + \frac{M2}{2\cdot L_b} \\
&= \frac{150+200}{4} + \frac{-27000}{2\times 90} + \frac{20500}{2\times 100} \\
&= 40\ (\mathrm{N})
\end{aligned}
$$

Similarly

$F_{r2} = -165$(N)
$F_{r3} = 340$(N)
$F_{r4} = 135$(N)

Lateral direction loads

$$
\begin{aligned}
M3 &= -\sum_{i=1}^{n}\{F_{xi}\cdot(Y_{xi}-Y_b)\} + \sum_{j=1}^{n}(F_{yj}\cdot X_{yj}) \\
&= F\cdot X_3 \\
&= -200\times(-50) \\
&= 10000\ (\mathrm{N\cdot mm})
\end{aligned}
$$

$$F_{s1}=F_{s3}=\frac{\sum_{j=1}^{n}F_{yj}}{4}+\frac{M3}{2\cdot\ell}$$
$$=\frac{F}{4}+\frac{M3}{2L_b}$$
$$=\frac{-200}{4}+\frac{10000}{2\times100}$$
$$=0\ (\mathrm{N})$$

Similarly

$F_{s2}=F_{s4}=-100(\mathrm{N})$

No work mounted on the table

Vertical direction load

$$M1=\sum_{j=1}^{n}\left(F_{yj}\cdot Z_{yj}\right)+\sum_{k=1}^{n}\left(F_{zk}\cdot Y_{zk}\right)$$
$$=F\cdot Z_3+W1\cdot Y_1$$
$$=-200\times30+150\times(-20)$$
$$=-9000\ (\mathrm{N\cdot mm})$$

$$M2=\sum_{i=1}^{n}\left\{F_{xi}\left(Z_{xi}-Z_b\right)\right\}+\sum_{k=1}^{n}\left(F_{zk}\cdot X_{zk}\right)$$
$$=W1\cdot X_1$$
$$=150\times30$$
$$=4500\ (\mathrm{N\cdot mm})$$

$$F_{r1}=\frac{\sum_{k=1}^{n}F_{zk}}{4}+\frac{M1}{2\cdot L}+\frac{M2}{2\cdot\ell}$$
$$=\frac{W1}{4}+\frac{M1}{2\cdot L_r}+\frac{M2}{2\cdot L_b}$$
$$=\frac{150}{4}+\frac{-9000}{2\times90}+\frac{4500}{2\times100}$$
$$=10\ (\mathrm{N})$$

Similarly

$F_{r2}=-35\ (\mathrm{N})$

$F_{r3}=110\ (\mathrm{N})$

$F_{r4}=\ \ 65\ (\mathrm{N})$

Lateral direction loads

$$M3=-\sum_{i=1}^{n}\left\{F_{xi}\cdot\left(Y_{xi}-Y_b\right)\right\}+\sum_{j=1}^{n}\left(F_{yj}\cdot X_{yj}\right)$$
$$=F\cdot X_3$$
$$=-200\times(-50)$$
$$=10000\ (\mathrm{N\cdot mm})$$

$$F_{s1}=F_{s3}=\frac{\sum_{j=1}^{n}F_{yj}}{4}+\frac{M3}{2\cdot\ell}$$
$$=\frac{F}{4}+\frac{M3}{2\cdot L_b}$$
$$=\frac{-200}{4}+\frac{10000}{2\times100}$$
$$=0\ (\mathrm{N})$$

Similarly

$F_{s2}=F_{s4}=-100\ (\mathrm{N})$

For calculation, take into consideration the positive or negative signs (+, -) for load point coordinate.

Calculation of dynamic equivalent load

Use **"A-3-2.2 (3) Calculation of dynamic equivalent load."**

It matches Position 4 in **"Table 2.3 Loads in the arrangement of linear guides."** Ball slide loads that must be considered are vertical and lateral direction loads.

In case of LU15AL,

Vertical direction dynamic equivalent load

$$F_r=F_r$$

Lateral direction dynamic equivalent load

$$F_{se}=F_s\cdot\tan\alpha=F_s$$

Use the formula for full dynamic equivalent load (Page A23) to calculate F_e.

Results are shown in the table below.

Unit: N

Work mounted	Slide1	Slide2	Slide3	Slide4
F_r ($F_{r1}-F_{r4}$)	40	– 165	340	135
F_{se} ($F_{s1}-F_{s4}$)	0	– 100	0	– 100
F_e	40	215	340	185
No work mounted	Slide1	Slide2	Slide3	Slide4
F_r ($F_{r1}-F_{r4}$)	10	– 35	110	65
F_{se} ($F_{s1}-F_{s4}$)	0	– 100	0	– 100
F_e	10	118	110	133

Based on the results of calculations, a ball slide that bears the maximum dynamic equivalent load shall be taken as the representative of the linear guides for further life calculation. For this case, we take the Slide3.

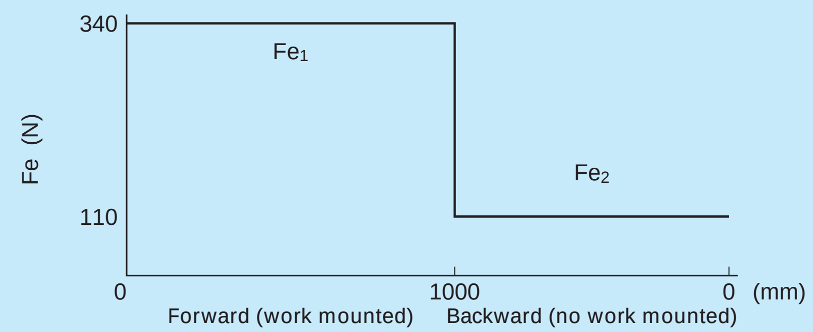
Therefore;

Work mounted $\quad$ $\boldsymbol{F_{e1}=340\ (\mathrm{N})}$

No work mounted $\quad$ $\boldsymbol{F_{e2}=110\ (\mathrm{N})}$

Calculation of mean effective load

Based on **"A-3-2.2 (4) Calculation of mean effective load,"** calculate from the largest full dynamic equivalent loads.



Cycle patterns of full dynamic equivalent load

From the cycle pattern, the mean effective load matches "① **When load and running distance vary by phase."** Therefore, use the following formula.

Assuming that L is: $L = L_1 + L_2$.

$$Fm = \sqrt[3]{\frac{1}{L}\left(F_{e1}^3 L_1 + F_{e2}^3 L_2\right)}$$

$$= \sqrt[3]{\frac{1}{2000}\left(340^3 \times 1000 + 110^3 \times 1000\right)}$$

$$= 273 \text{ (N)}$$

Determine various coefficients

Determine applicable coefficients from **"A-3-2.2 (5) Various coefficients."**

Load factors

Use conditions are: Travel speed, 12 m/min; Acceleration, 0.8 m/sec^2 (0.082G). As the load factor f_w is in the range of 1.0 to 1.5, use common value f_w **= 1.2.**

Hardness coefficient

The hardness of NSK linear guides is HRC58 – 62. Use a hardness coefficient f_H **= 1** and take the value of basic dynamic load rating as it is.

Calculate rating life

Use **"A-3-2.2 (6) Calculation of rating life."**

The basic dynamic load rating (C) of linear guide LU15AL : 5550 (N)

Mean effective load F_m : 273 (N)

Load factor f_w : 1.2

Hardness coefficient f_H : 1

$$\text{Rating fatigue life } L = 50 \times \left(\frac{f_H \bullet C}{f_w \bullet F_m}\right)^3$$

$$= 50 \times \left(\frac{1 \times 5550}{1.2 \times 273}\right)^3$$

= approximately 243110 (km)

Travel speed, 12 m/min; Operating hours, 16 hr/day.

Convert the above rating fatigue life into hours:

$$\frac{243110 \times 1000}{12 \times 60 \times 16} = \text{approximately } 21100 \text{ (days)}$$

Examine static load

Based on **"A-3-2.2 (7) Examination of static load,"** find out on which ball slide the static equivalent load P_0 becomes largest.

The basic static load rating (C_0) of linear guide LU15AL: 6600 (N)

Ball slide No. 3 bears the largest load.

P_0 at this time:

$P_0 = F_r + F_s = 340$

Therefore, static permissible load coefficient fs is:

$$fs = \frac{C_0}{P_0} = \frac{6600}{340} = 19.4$$

There is no problem at this value.

(1)-3 Selection of accuracy grade and preload

Based on **"A-1-3.4 (2) Application examples of accuracy,"** select accuracy grade PN and preload Z1 for material handling system.

(1)-4 Calculation of deformation

Calculate deformation by the weight of the mounted work W$_2$. From **"Rigidity of LU series,"** the rigidity of linear guide LU15AL with Z1 preload is:

$K_s = K_r$ **= 45 (N/μm) = 45000 (N/mm)**

Deformation by the weight of the mounted work W_2 can be obtained as the difference in deformation when W_2 applies or does not apply.

From Pattern 4 in Table 2.2 (Page A19)

Work mounted:

$$\delta_{x1} = Y_d \cdot \frac{F_{s2} - F_{s1}}{L_b \cdot K_s} + Z_d \cdot \frac{F_{r1} - F_{r2}}{L_b \cdot K_r}$$

$$= -90 \times \frac{-100 - 0}{100 \times 45000} + 120 \times \frac{40 - (-165)}{100 \times 45000}$$

$$= 0.0075 \text{ (mm)} = 7.5 \text{ (μm)}$$

Similarly, δ_{y1} = – 0.0082 (mm) = – 8.2 (μm)

δ_{z1} = 0.0123 (mm) = 12.3 (μm)

No work mounted:

$$\delta_{x2} = Y_d \cdot \frac{F_{s2} - F_{s1}}{L_b \cdot K_s} + Z_d \cdot \frac{F_{r1} - F_{r2}}{L_b \cdot K_r}$$

$$= -90 \times \frac{-100 - 0}{100 \times 45000} + 120 \times \frac{10 - (-35)}{100 \times 45000}$$

$$= 0.0032 \text{ (mm)} = 3.2 \text{ (μm)}$$

Similarly, δ_{y2} = –0.0023 (mm) = –2.3 (μm)

δ_{z2} = 0.0039 (mm) = 3.9 (μm)

Therefore, the difference in deformation by whether there is a mounted work or not is as follows:

$\delta_x = \delta_{x1} - \delta_{x2}$ = 7.5 –3.2 = 4.3 (μm)

$\delta_y = \delta_{y1} - \delta_{y2}$ = –8.2 – (–2.3) = –5.9 (μm)

$\delta_z = \delta_{z1} - \delta_{z2}$ = 12.3 –3.9 = 8.4 (μm)

(2) Machining Center

The following is a case calculation for a horizontal type machining center. Arrangements of each axis are shown in Fig. 10.2 and Fig. 10.3.

Operating conditions

Dimensions and load conditions are:

X axis column's weight Wx : 7500 (N)

Y axis spindle head's weight Wy : 2500 (N)

Z axis table's weight Wz : 5500 (N)

X axis rail span XL_r : 450 (mm)

X axis ball slide span XL_b : 310 (mm)

Y axis rail span YL_r : 410 (mm)

Y axis ball slide span YL_b : 308 (mm)

Z axis rail span ZL_r : 660 (mm)

Z axis ball slide span ZL_b : 420 (mm)

X axis stroke : 400 (mm)

Y axis stroke : 350 (mm)

Z axis stroke : 500 (mm)

Average rapid traverse speed : 15 (m/min) [Max. 30 (m/min)]

Starting accelerating speed : 1 (G)

Milling speed : 2.5 (m/min)

Drilling speed : 0.8 (m/min)

Cutting load

Milling process $Fx = Fy$ = 1000 (N)

Drilling process Fz = 3000 (N)

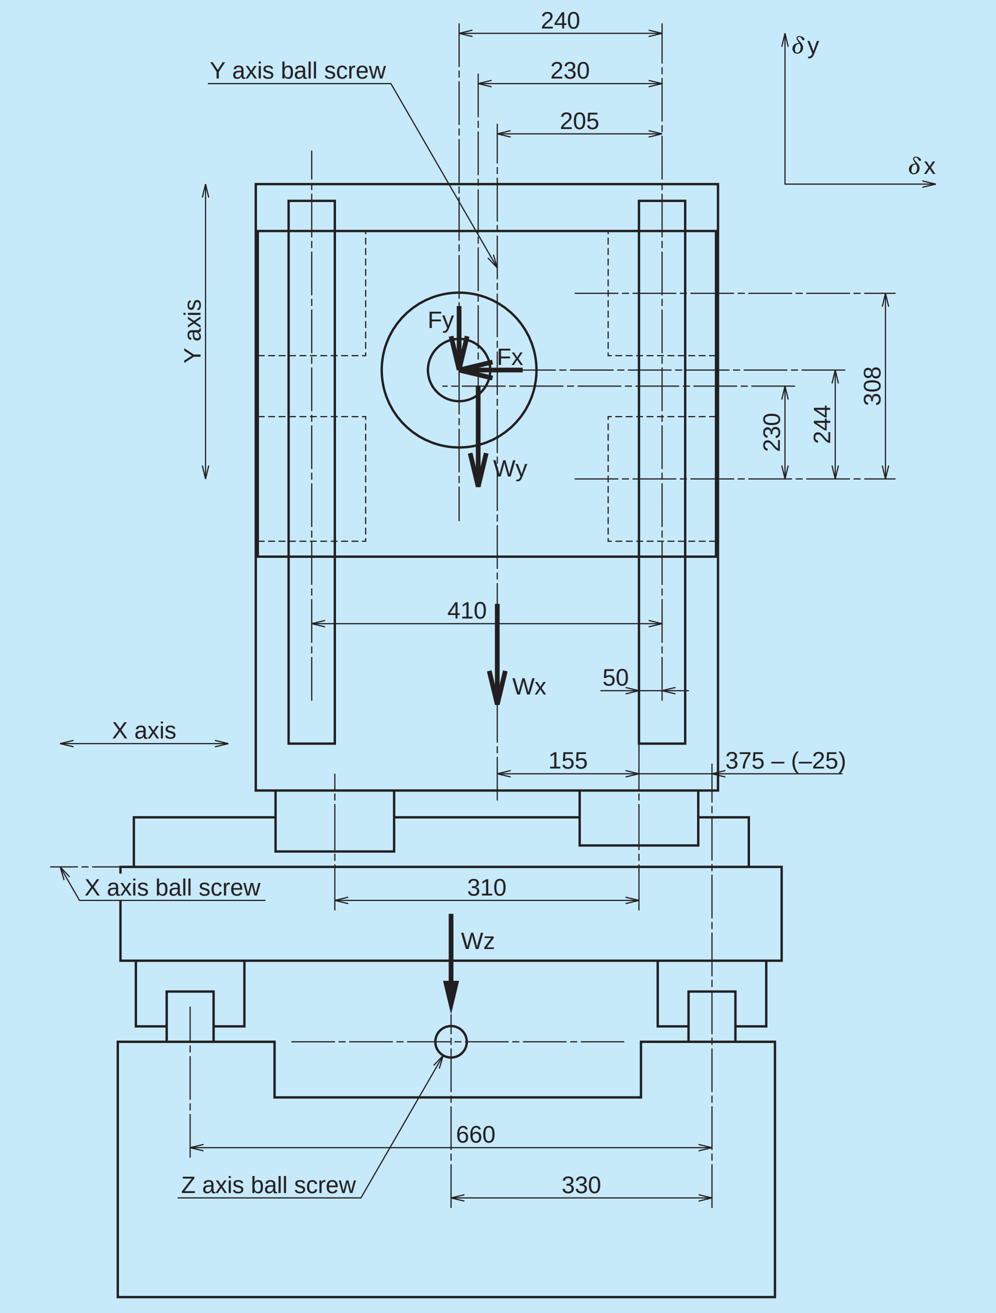


Fig. 10.2 Machining center (front view)

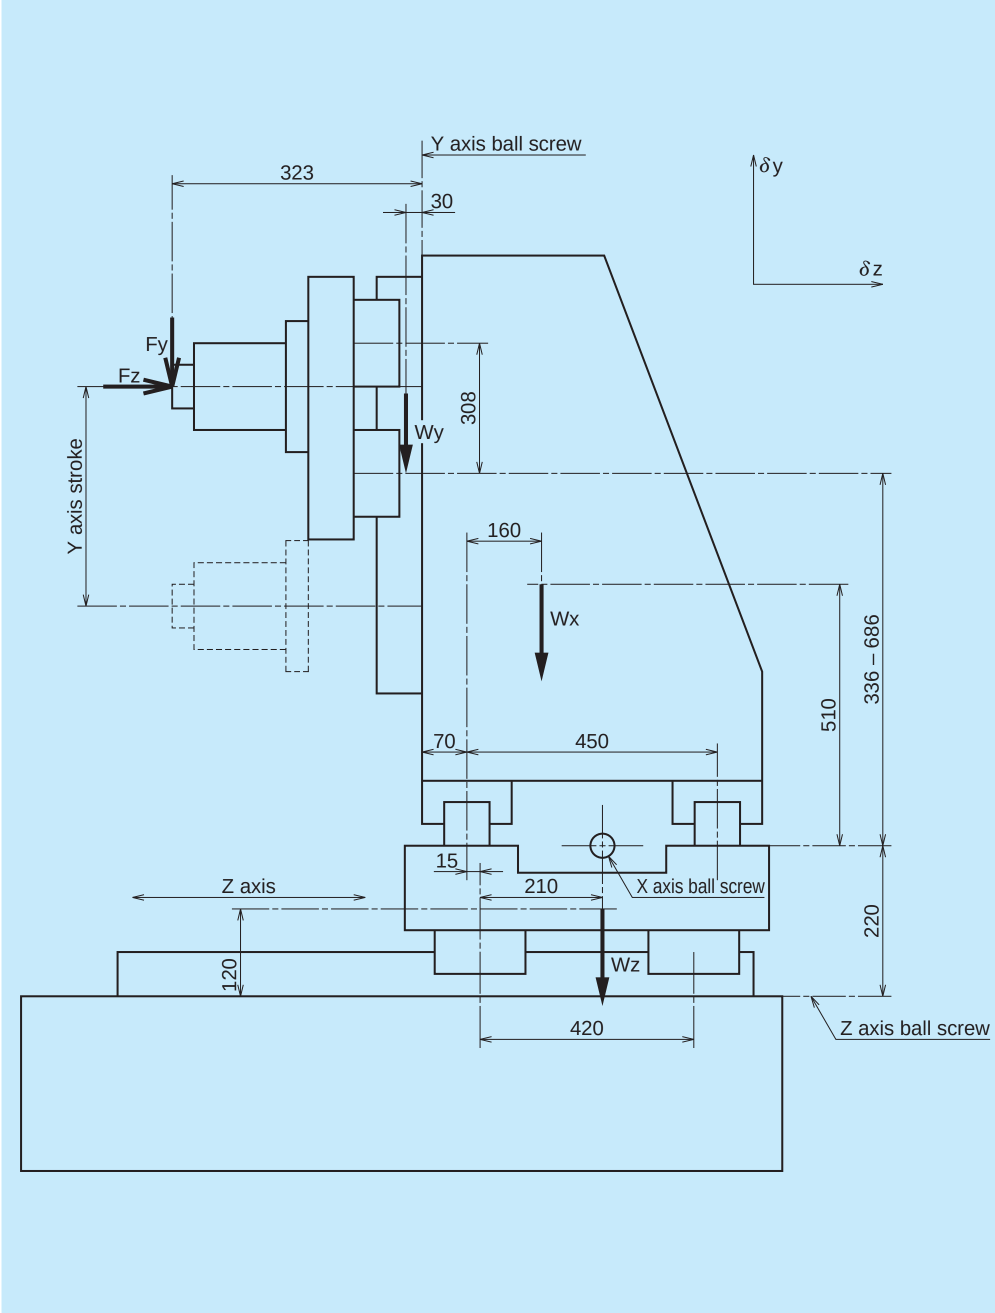

Fig. 10.3 Machining center (side view)

(2)-1 Selection of linear guide model

From the operating conditions, the linear guide should be LA Series which is suitable for the machining center.

Select below temporaly from shaft diameter of ball screw:

X axis LA55
Y axis LA35
Z axis LA65

(2)-2 Calculation of life expectation

Examination shall be done in three cases, no cutting load; milling process; and drilling process.
Inertial force associated with the starting acceleration is not considered in this case. However, it must be calculated for more accurate figures.

Calculation of the loads that apply to the ball slide

In case of no cutting load: *F*x = *F*y = *F*z = 0

Calculate load on X, Y, Z axes using **"Table 2.2"** in **"A-3-2.2 (2) Calculating load to a ball slide."**

X axis: Loads to consider Wx and Wy
Y axis: Loads to consider Wy
Z axis: Loads to consider Wx, Wy, and Wz

Unit: N

Axis	Load direction	Slide1	Slide2	Slide3	Slide4
X axis	Vertical direction *F*r	1156	955	4045	3844
	Lateral direction *F*s	0	0	0	0
Y axis	Vertical direction *F*r	122	−122	122	−122
	Lateral direction *F*s	102	−102	102	−102
Z axis	Vertical direction *F*r	765	3860	3890	6985
	Lateral direction *F*s	0	0	0	0

In case of milling process: *F*x = *F*y = 1000 (N)

Similarly,
X axis: Loads to consider *W*x, *W*y, *F*x, and *F*y
Y axis: Loads to consider *W*y, *F*x, and *F*y
Z axis: Loads to consider *W*x, *W*y, *W*z, *F*x, and *F*y

The table below shows calculation of each load coordinates at stroke end which imposes most strict condition.

Unit: N

Axis	Load direction	Slide1	Slide2	Slide3	Slide4
X axis	Vertical direction *F*r	2277	−1039	6539	3224
	Lateral direction *F*s	997	−997	997	−997
Y axis	Vertical direction *F*r	252	−1040	1040	−252
	Lateral direction *F*s	54	−554	54	−554
Z axis	Vertical direction *F*r	−771	3796	4453	9020
	Lateral direction *F*s	486	−986	486	−986

In case of drilling process: *F*z = 3000 (N)

X axis: Loads to consider *W*x, *W*y, and *F*z
Y axis: Loads to consider *W*y and *F*z
Z axis: Loads to consider *W*x, *W*y, *W*z, and *F*z

The table below shows calculation of each load coordinates at a stroke end which imposes most strict condition.

Unit: N

Axis	Load direction	Slide1	Slide2	Slide3	Slide4
X axis	Vertical direction *F*r	4256	4055	945	744
	Lateral direction *F*s	919	581	919	581
Y axis	Vertical direction *F*r	305	938	561	1195
	Lateral direction *F*s	102	−102	102	−102
Z axis	Vertical direction *F*r	4872	−247	7997	2878
	Lateral direction *F*s	839	−839	839	−839

Calculation of dynamic equivalent load

Next, find dynamic equivalent load under each cutting condition. From **"Table 2.3"** in **"A-3-2.2 (3) Calculation of dynamic equivalent load,"** necessary load *F*r and *F*se are, as the linear guide model is LA Series, obtained as follows.

Vertical dynamic equivalent load

***F*r = *F*r**

Lateral dynamic equivalent load

***F*se = *F*s • tan α = Fs**

From above, calculate *F*e using formulas for full dynamic equivalent loads shown in Page A23.
From calculation, the largest full dynamic equivalent loads are as follows.

Axis	Largest full dynamic equivalent load Fe (N)		
	No cutting load	For milling process	For drilling process
X axis	4045	7038	4716
Y axis	173	1317	1246
Z axis	6985	9513	8417

Calculation of mean effective load

Calculate the mean effective loads from full dynamic equivalent loads. If duty cycle in the cutting process is not clear, set at 70% of the largest full dynamic equivalent load in all processes.

Therefore,

X axis: 7038 × 0.7 = 4927 (N)
Y axis: 1317 × 0.7 = 922 (N)
Z axis: 9513 × 0.7 = 6659 (N)

Determine various coefficients

Determine based on **"A-3-2.2 (5) Various coefficients."**

In this occasion,

Load coefficient f_w : 1.5

Hardness coefficient f_H : 1

Calculation of rating life

Based on the calculated loads and various coefficients, calculate life from **"A-3-2.2 (6) Calculation of rating life."**

Basic dynamic load rating C
(X axis linear guide LA55): 139000 (N)

Basic dynamic load rating C
(Y axis linear guide LA35): 61500 (N)

Basic dynamic load rating C
(Z axis linear guide LA65): 260000 (N)

Load coefficient f_W: 1.5

Hardness coefficient f_H: 1

Rating fatigue life $L = 50 \times \left(\frac{f_H \cdot C}{f_w \cdot F_m}\right)^3$

From this,

In case of X axis Lx = 332650 (km)

In case of Y axis Ly = 4396720 (km)

In case of Z axis Lz = 881830 (km)

In case of roller, shown in **A-3-2.2 (6) "Calculation of rating life"** (Page A26)

Examination of static loads based on "A-3-2.2 (7)"

Basic static load rating C_0
(X axis linear guide LA55): 215000 (N)

Basic static load rating C_0
(Y axis linear guide LA35): 98000 (N)

Basic static load rating C_0
(Z axis linear guide LA65): 420000 (N)

Examine for milling process with large load.

$$\text{X axis } fs = \frac{C_0}{P_0} = \frac{C_0}{(F_r + F_s)} = \frac{215000}{(6539 + 997)} = 28.5$$

Similarly,

Y axis fs = 61.5

Z axis fs = 42.0

Therefore, there is no problem.

(2)-3 Selection of accuracy grade and preload

For machining center, select accuracy grade P5, and preload Z3.

(2)-4 Calculation of deformation

Calculate deformation at processing points (stroke position is the stroke end positions on Y axis and X axis)

Rigidity of X axis linear guide LA55Z3 : 1400 (N/µm)

Rigidity of Y axis linear guide LA35Z3 : 825 (N/µm)

Rigidity of Z axis linear guide LA65Z3 : 1730 (N/µm)

Calculate using Pattern 4 in Table 2.2.

Load conditions	Deformation direction	Deformation of each axis (µm)			Total deformation (µm)
		X axis	Y axis	Z axis	
Table weight alone	δx	−0.2	−0.1	−3.1	−3.4
	δy	−4.6	−0.3	−4.2	−9.1
	δz	−4.3	−0.1	−4.9	−9.3
Milling process	δx	−9.9	−1.3	−6.7	−17.9
	δy	−6.4	−1.7	−5.2	−13.3
	δz	−6.1	−0.4	−7.7	−14.2
Drilling process	δx	−0.9	−0.3	−4.6	−5.8
	δy	1.4	0.8	2.8	5.0
	δz	5.5	1.2	7.6	14.3

Therefore, deformation at processing points at time of milling is:

δx = −17.9 − (−3.4) = −14.5 (µm)

δy = −13.3 − (−9.1) = −4.2 (µm)

δz = −14.2 − (−9.3) = −4.9 (µm)

Deformation at processing points at time of milling:

δx = −5.8 − (−3.4) = −2.4 (µm)

δy = 5.0 − (−9.1) = 14.1 (µm)

δz = 14.3 − (−9.3) = 23.6 (µm)

If a life of this long period is not required, select a smaller linear guide model, and calculate life again.

To reduce deformation at processing point, select a linear guide model with higher rigidity. Then calculate life again.

A-4 NSK Linear Guides™

(1) Structure of NSK Linear Guides

By avoiding structural complexity, and by reducing the number of components, we not only enhanced the precision of linear guides, but also are able to keep costs low. We have added NSK's patented unique structural feature to the original invention (Fig. 1). This contributes to higher precision and lower prices.
NSK linear guide consists of a rail and a ball or roller slide (Fig. 2). The balls or rollers roll on the race way surface, and are scooped up by the end caps attached to both ends of the ball or roller slide. Then, the balls or rollers go through a passage made in the ball or roller slides and circulate back to the other end.

(2) Characteristics of NSK Linear Guides

The use of a unique offset Gothic arch groove (Fig. 3) allows the ball type of NSK linear guides to satisfy groove designs required for specific purposes.
This unique ball groove design facilitates precise measurement of the ball groove, thus enabling stable and highly accurate production of the ball slides and the rails for random matching. (Fig. 4)
On top of that, we have developed and marketed the NSK Roller Guides, representing the culmination of NSK's analysis technology and tribology.
Such technologies ensure the feature of NSK linear guides outlined below.

1. High precision and quality

- High precision and quality come from our superb production and measuring technologies, strengthened by extensive experience in antifriction rotary bearings and ball screw production. Our quality assurance extends to the smallest components.

2. High reliability and durability

- Logical simplicity in shape, along with stable processing, maintains high precision and reliability.
- Super-clean materials, our advanced heat treatment and processing technologies increase product durability.

3. Abundant in type for any purpose

- Various series are available, and their slide models and size categories are standardized to satisfy any requirement. Our technology, polished by abundant experience in the use of special materials and surface treatments, meets the customer's most demanding expectations.

4. Development of random-matching parts for short delivery time

- The adoption of the Gothic arch groove which makes measuring easy, and a reliable quality control method has made random-matching of the rails and the ball or roller slides possible. The parts are stocked as standard products, thereby reducing delivery time.

5. Patented static load carrying capacity (shock-resistance)

- When a super-high load (impact) is applied, our Gothic arch groove spreads the load to surfaces which usually do not come into contact in ball type. This increases shock resistance (Fig. 5).

6. Lineup of extremely high-load capacity series

- The LA series provides a top class high-load capacity for the ball linear guides through a unique load carrying configuration with three ball recirculation circuits on the one side.
  By installing rollers that are the largest possible diameter and length, the NSK roller linear guides have realized the world highest load capacity, far superior to the roller linear guides of other companies.

Measuring grooves is easy. You can obtain highly accurate results for all types of NSK series. This is why you can purchase rails and slides separately for random matching.

(2) Telephone consultation with NSK engineers

This catalog contains technical explanation for each section. However, some descriptions and explanations may be insufficient due to page limitation, etc. To amend this shortcoming, NSK offers telephone assistance. NSK engineers are pleased to help you. Our local offices are listed in the last part of this catalogue. Call local NSK office or representative in your area.

(5) Linear Guides: Handling Precautions

NSK linear guides are high quality and are easy to use. NSK places importance on safety in design. For maximum safety, please follow precautions as outlined below.

1. Lubrication

Confirm lubrication.

a. If your linear guide is rust prevention specification, thoroughly wipe the rust prevention oil, and put lubricant inside of slide before using.

b. If you are using oil as lubricant, the oil may not reach the raceway depending on how the slide is installed. Consult NSK in such case.

2. Handling

Handle with care.

Do not disassemble.

Do not drop.

Do not give impact.

a. Random-matching slides are installed to the provisional rail when they leave the factory. Handle the slide with care during installation to the rail.

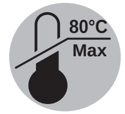
b. Do not disassemble the guide unless absolutely necessary. Not only does it allow dust to enter, but it lessens precision.

c. Slide may move by simply leaning the rail. Make sure that the slide does not disengage from the rail.

d. Standard end cap is made of plastic. Beating it or hitting it against an object may cause damage.

3. Precautions in use

Do not contaminate.



Temperature limitation.

Do not hang upside down.

a. Make every effort not to allow dust and foreign objects to enter.

b. Please apply splash guard or bellows to the linear guide to prevent sticking resolvent or coolant when it contains corrosive material.

c. The temperature of the place where linear guides are used should not exceed 80°C (excluding heat-resistant type linear guides). A higher temperature may damage the plastic end cap.

d. If the user cuts the rail, thoroughly remove burrs and sharp edges on the cut surface.

e. When hanging upside-down (e.g. the rail is installed upside-down on the ceiling in which the slide faces downward), should the end cap be damaged, causing the balls or rollers to fall out, the slide may be detached from the rail and fall. For such use, take measures including installing a safety device.

4. Storage

Store in the correct position.

a. Linear guide may bend if the rail is stored in inappropriate position. Place it on a suitable surface, and store it in a flat position.

(6) Design Precautions

The following points must be heeded in examining the life.

In case of oscillating stroke

- If the balls or rollers do not rotate all the way, but only halfway, and if this minute stroke is repeated, lubricant disappears from the contact surface of balls or rollers and raceways. This generates "fretting," a premature wear. Fretting cannot be entirely prevented, but it can be mitigated.
- A grease which prevents fretting is recommended for oscillating stroke operations. Using a standard grease, life can be markedly prolonged by adding a normal stroke travel (about the slide length) once every several thousand cycles.

When applying pitching or yawing moment

- Load applied to the ball or roller rows inside the slide is inconsistent if pitching or yawing moment load is applied. Loads are heavy on the balls or rollers on each end of the row.
- In such case, a heavy load lubricant grease or oil are recommended. Another countermeasure is using one size larger model of linear guide to reduce the load per ball or roller.
- Moment load is insignificant for 2-rail, 4-slides combination which is commonly used.

When an extraordinary large load is applied during stroke

- If an extraordinary large load is applied at certain position of the stroke, calculate not only the life based on the mean effective load, but also the life based on the load in this range.
- When an extraordinary heavy load is applied and thus the application of high tensile stress to fixing bolts of the rails and slides is foreseen, the strength of the bolts should be considered.

When calculated life is extraordinarily short
(Less than 3000 km in calculated life.)

- In such case, the contact pressure to the balls or rollers and the rolling contact surface is extraordinarily high.
- Operated under such state continually, the life is significantly affected by the loss of lubrication and the presence of dust, and the actual life becomes shorter than calculated.
- It is necessary to reconsider arrangement, the number of slide, and the type of model in order to reduce the load to the slide.
- It is necessary to consider preload for calculation of rating life, when selecting Z3 (medium preload) or Z4 (heavy preload) as a preload. Please consult NSK.

Application at high speed

- The standard maximum allowable speed of a linear guide under normal conditions is 100 m/min. However, the maximum allowable speed can be affected by accuracy of installation, temperature, external loading etc.
- The end cap with high speed specification must be used when operating speed exceeds the permissible speed. Please consult NSK.

A-5 Technical Description and Dimension Table for NSK Linear Guides

A-5-1 General Industrial Use

A-5-1.1 SH Series

(1) Features

1. Lower noise and gentler tone

Incorporating a retainer piece and optimizing the circulation path enables steel ball circulation stability and the prevention of ball collision, resulting in noise reduction.

2. Smoother motion

Improved steel ball circulation stability, free of interference between the balls improves dynamic friction characteristics, resulting in smooth and stable motion, which is especially effective for low speed motion.

3. Low dust generation

A resin retaining piece, which prevents steel balls collision, features effective low dust generation characteristics compared to conventional products.

4. High self-aligning capability (rolling direction)

Same as the DF combination in angular contact bearings, self-aligning capability is high because the cross point of the contact lines of balls and grooves comes inside, reducing moment rigidity. This increases the capacity to absorb errors in installation.

5. High load carrying capacity to vertical direction

The contact angle is set at 50 degrees, increasing load carrying capacity as well as rigidity in vertical direction.

6. High resistance against impact load

The bottom ball groove is formed in Gothic arch and the center of the top and bottom grooves are offset as shown in Fig. 2. The vertical load is generally carried by the top rows, where balls are contacting at two points. Because of this design, the bottom rows will carry load when a large impact load is applied vertically as shown in Fig. 3. This assures high resistance to the impact load.

7. High accuracy

As showing in Fig. 4, fixing the master rollers is easy thanks to the Gothic arch groove. This makes easy and accurate measuring of ball grooves.

8. Fast delivery

Lineup of random-matching rails and ball slides supports and facilitates fast delivery.

(6) Lubrication components

Refer to page A38 and D13 for the lubrication of linear guides.

1. Types of lubrication accessories

Figure 11 and Table 10 show grease fittings and tube fittings.

We provide lubrication accessories with extended thread body length (L) for the addition of dust proof accessories such as NSK K1 lubrication unit, double seal and protector.

We provide a suitable lubrication accessory for the special requirement on dust proof accessories.

Consult NSK for a lubrication accessory with extended length of thread body for your convenience of replenishing lubricant.

Please ask NSK for stainless lubrication accessories.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of ball slide. We mount them on a side of end cap for an option. (Fig. 12)

Please consult NSK for installation of grease or tube fittings to the ball slide body or side of end cap.

When using a piping unit with thread of M6 × 1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

(7) Dust proof components

1. Standard specification

To keep foreign matters from entering inside the ball slide, SH Series has an end seal on both ends, and bottom seals at the bottom.

Remarks: Values of odd numbers BL (3, 5, 7, ...) can be obtained by adding two values of even number BLs on both sides, then dividing the sum by two.

Note: We recommend using SH Series in a clean environment in order to utilize their full range of capabilities.

(8) Reference number

Reference numbers shall be set to individual NSK linear guide when its specifications are finalized, and it is indicated on its specification drawing.
Please specify the reference number, except design serial number, to identify the product when ordering, requiring estimates, or inquiring about specifications from NSK.

Remarks: 1) Parenthesized dimensions are applicable to stainless steel products.
2) The external appearance of stainless steel ball slides differs from those of standard material ball slide.

3) The basic dynamic load rating is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface. When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26.

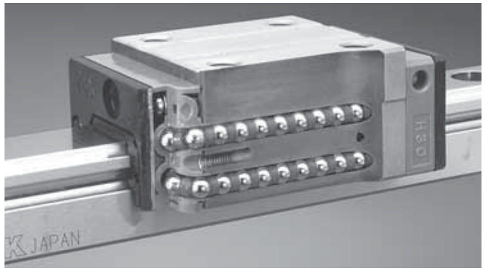
A-5-1.2 SS Series



(1) Features

1. Lower noise and gentler tone
Incorporating a retainer piece and optimizing the circulation path enables steel ball circulation stability and the prevention of ball collision, resulting in noise reduction.

2. Smoother motion
Improved steel ball circulation stability, free of interference between the balls improves dynamic friction characteristics, resulting in smooth and stable motion, which is especially effective for low speed motion.

3. Low dust generation
A resin retaining piece, which prevents steel balls collision, features effective low dust generation characteristics compared to conventional products.

4. High self-aligning capability (rolling direction)
Same as the DF combination in angular contact bearings, self-aligning capability is high because the cross point of the contact lines of balls and grooves comes inside, reducing moment rigidity. This increases the capacity to absorb errors in installation.

5. High load carrying capacity to vertical direction
The contact angle is set at 50 degrees, increasing load carrying capacity as well as rigidity in vertical direction.

6. High resistance against impact load
The bottom ball groove is formed in Gothic arch and the center of the top and bottom grooves are offset as shown in Fig. 2. The vertical load is generally carried by the top rows, at where balls are contacting at two points. Because of this design, the bottom rows will carry load when a large impact load is applied vertically as shown in Fig. 3. This assures high resistance to the impact load.

7. High accuracy
As showing in Fig. 4, fixing the master rollers is easy thanks to the Gothic arch groove. This makes easy and accurate measuring of ball grooves.

8. Fast delivery
Lineup of random-matching rails and ball slides supports and facilitates fast delivery.

2. Accuracy standard

The preloaded assembly has five accuracy grades; Ultra precision P3, Super precision P4, High precision P5, Precision P6 and Normal PN grades, while the random-matching type has Normal PC grade.

• Tolerance of preloaded assembly

(6) Lubrication components

Refer to page A38 and D13 for the lubrication of linear guides.

1. Types of lubrication accessories

Figure 11 and Table 10 show grease fittings and tube fittings.
We provide lubrication accessories with extended thread body length (L) for the addition of dust proof accessories such as NSK K1 lubrication unit, double seal and protector.
We provide a suitable lubrication accessory for the special requirement on dust proof accessories.
Consult NSK for a lubrication accessory with extended length of thread body for your convenience of replenishing lubricant.
Please ask NSK for stainless lubrication accessories.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of ball slide. We mount them on a side of end cap for an option. (Fig. 12)
Please consult NSK for installation of grease or tube fittings to the ball slide body or side of end cap.
When using a piping unit with thread of M6 × 1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

(7) Dust proof components

1. Standard specification

To keep foreign matters from entering inside the ball slide, SS Series has an end seal on both ends, and bottom seals at the bottom.

3. Double seal

Use a double seal set as showing in Table 13, when installing an extra seal to completed standard products. (Fig. 14)
When installing a grease fitting after the installation of double seals, a connector is required.

4. Protector

Use a protector set as showing Table 14, when installing a protector to completed standard products. (Fig.15)
When installing a grease fitting after the installation of protectors, a connector is required.

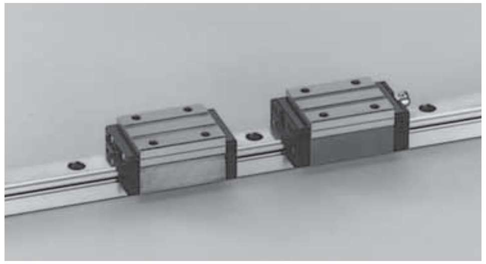
A-5-1.3 LH Series



(1) Features

1. High self-aligning capability (rolling direction)

Same as the DF combination in angular contact bearings, self-aligning capability is high because the cross point of the contact lines of balls and grooves comes inside, reducing moment rigidity.
This increases the capacity to absorb errors in installation.

2. High load carrying capacity to vertical direction

The contact angle is set at 50 degrees, increasing load carrying capacity as well as rigidity in vertical direction.

3. High resistance against impact load

The bottom ball groove is formed in Gothic arch and the center of the top and bottom grooves are offset as shown in Fig. 2. The vertical load is generally carried by the top rows, where balls are contacting at two points. Because of this design, the bottom rows will carry load when a large impact load is applied vertically as shown in Fig. 3. This assures high resistance to the impact load.

4. High accuracy

As showing in Fig. 4, fixing the master rollers is easy thanks to the Gothic arch groove. This makes easy and accurate measuring of ball grooves.

5. Easy to handle, and designed with safety in mind.

Balls are retained in the retainer, therefore they do not fall out when the ball slide is withdrawn from the rail. (LH10 to LH65)

6. Abundant models and sizes

Each series has various models of ball slides, rendering the linear guide available for numerous uses.

7. Fast delivery

Lineup of random-matching rails and ball slides supports and facilitates fast delivery. (LH15 to LH65)

Note: LH08, 10, and 12 are not available in random matching. For LH08,10, and 12, P4, P5, P6, and PN grades are available.

2. Accuracy standard

The preloaded assembly has five accuracy grades; Ultra precision P3, Super precision P4, High precision P5, Precision P6 and Normal PN grades, while the random-matching type has Normal PC grade.

• Tolerance of preloaded assembly

5. Preload and rigidity

We offer five levels of preload: slight preload Z1, medium preload Z3 and fine clearance Z0, along with random-matching type of fine clearance ZT and slight preload ZZ. Values for preload and rigidity of the preloaded assembly are shown in Table 5. Rigidities are for the median of the preload range.

(6) Lubrication components

Refer to page A38 and D13 for the lubrication of linear guides.

1. Types of lubrication accessories

Figure 11 and Table 10 show grease fittings and tube fittings.

We provide lubrication accessories with extended thread body length (L) for the addition of dust proof accessories such as NSK K1 lubrication unit, double seal and protector.

We provide a suitable lubrication accessory for the special requirement on dust proof accessories.

Consult NSK for a lubrication accessory with extended length of thread body for your convenience of replenishing lubricant.

Please ask NSK for stainless lubrication accessories.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of ball slide. We mount them on a side of end cap for an option. (Fig. 12)

Please consult NSK for installation of grease or tube fittings to the ball slide body or side of end cap.

When using a piping unit with thread of M6×1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

(7) Dust proof components

1. Standard specification

To keep foreign matters from entering inside the ball slide, LH Series has an end seal on both ends, and bottom seals at the bottom.

However, the bottom seals are not used to LH08 and 10.

3. Double seal

Use a double seal set as showing in Table 13, when installing an extra seal to completed standard products. (Fig. 14)

When installing a grease fitting after the installation of double seals, a connector is required.

4. Protector

Use a protector set as showing Table 14, when installing a protector to completed standard products. (Fig.15)

When installing a grease fitting after the installation of protectors, a connector is required.

Remarks : 1) LH08 does not have a ball retainer. Be aware that balls fall out when the ball slide is withdrawn from the rail.
2) The external appearance of stainless steel ball slides differs from those of standard material ball slide.
3) Only stainless steel models are available for LH08 to LH12.
4) The basic dynamic load rating is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface. When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26.
5) Random matching is available for LH15 to LH65.

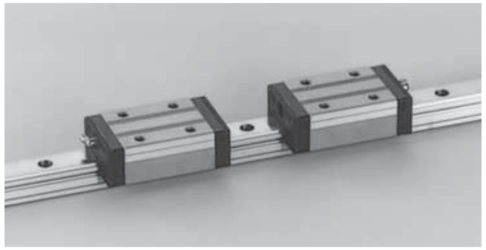
A-5-1.4 LS Series



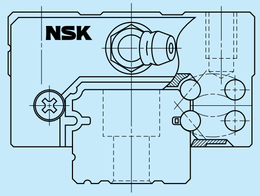


Fig. 1 LS Series

(1) Features

1. High self aligning capability (rolling direction)

Same as the DF combination in angular contact bearings, self-aligning capability is high because the cross point of the contact lines of balls and grooves comes inside, reducing moment rigidity. This increases the capacity to absorb errors in installation.

2. High load carrying capacity to vertical direction

The contact angle is set at 50 degrees, increasing load carrying capacity as well as rigidity against the load in vertical direction.

3. High resistance against impact load

The bottom ball groove is formed in Gothic arch and the center of the top and bottom grooves are offset as shown in Fig. 2. The vertical load is usually carried by top 2 rows, where balls are contacting at two points. Because of this design, the bottom rows will carry the load when a large impact load is applied as shown in Fig. 3. This assures high resistance to the impact load.

4. High accuracy

As showing in Fig. 4, fixing the measuring rollers is simple thanks to the Gothic arch groove. This makes easy and accurate measuring of ball- grooves.

5. Easy to handle, and designed with safety in mind.

Balls are retained in the retainer and do not fall out when the ball slide is withdrawn from the rail.

6. Abundant models and sizes come in series.

Each series has several ball slide models, rendering the linear guide available for numerous uses. The LS Series also has standardized long stainless- steel rail (maximum: 3 500 mm).

7. Fast delivery

Lineup of random-matching rails and ball slides supports and facilitates fast delivery.

2. Accuracy standard

The preloaded assembly has five accuracy grades; Ultra precision P3, Super precision P4, High precision P5, Precision P6 and Normal PN grades, while the random-matching type has Normal PC grade.

• Tolerance of preloaded assembly

5. Preload and rigidity

We offer five levels of preload: slight preload Z1, medium preload Z3 and fine clearance Z0, along with random-matching type of fine clearance ZT and slight preload ZZ. Values for preload and rigidity of the preloaded assembly are shown in Table 5. Rigidities are for the median of the preload range.

(6) Lubrication components

Refer to page A38 and D13 for the lubrication of linear guides.

1. Types of lubrication accessories

Figure 11 and Table 10 show grease fittings and tube fittings.

We provide lubrication accessories with extended thread body length (L) for the addition of dust proof accessories such as NSK K1 lubrication unit, double seal and protector.

We provide a suitable lubrication accessory for the special requirement on dust proof accessories.

Consult NSK for a lubrication accessory with extended length of thread body for your convenience of replenishing lubricant.

Please ask NSK for stainless lubrication accessories.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of ball slide. We mount them on a side of end cap for an option. (Fig. 12)

Please consult NSK for installation of grease or tube fittings to the ball slide body or side of end cap.

When using a piping unit with thread of M6×1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

1. Standard specification

To keep foreign matters from entering inside the ball slide, LS Series has an end seal on both ends, and bottom seals at the bottom.

Use a double seal set as showing in Table 13, when installing an extra seal to completed standard products. (Fig. 14)
When installing a grease fitting after the installation of double seals, a connector is required.

4. Protector

Use a protector set as showing Table 14, when installing a protector to completed standard products. (Fig.15)
When installing a grease fitting after the installation of protectors, a connector is required.

(8) Reference number

Reference numbers shall be set to individual NSK linear guide when its specifications are finalized, and it is indicated on its specification drawing.
Please specify the reference number, except design serial number, to identify the product when ordering, requiring estimates, or inquiring about specifications from NSK.

Remarks: 1) The external appearance of stainless steel ball slides differs from those of standard material ball slide.
2) Parenthesized dimensions are for items made of stainless steel.

3) The basic dynamic load rating is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface. When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26.

* Standard mounting hole of LS15 rail is for M3 bolts (Hole size: 3.5×6×4.5). If you require the mounting hole for M4 bolts (Hole size: 4.5×7.5×5.3), please specify it when ordering.

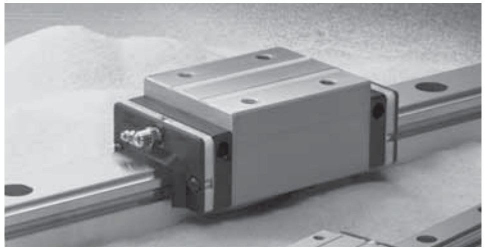
A-5-1.5 VH Series



(1) Features

1. High-performance end seals

High-performance end seals with a multi-lip structure prevent the entry of various foreign matters.

2. NSK K1™ lubrication unit (standard)

Outstanding lubrication support of NSK K1 further improves sealing capability and durability. Additional NSK K1 units can be mounted for specific usage conditions and environments.

3. Tapped holes on a rail bottom face (optional)

In addition to standard mounting bolt holes (counterbores on a rail top face), a specification for tapped holes on a rail bottom face for enhanced sealing capability is available for the VH Series. (Refer to the dimension table)

4. High self-aligning capability (rolling direction)

Same as the DF combination in angular contact bearings, self-aligning capability is high because the cross point of the contact lines of balls and grooves comes inside, reducing moment rigidity.

This increases the capacity to absorb errors in installation.

5. High load carrying capacity to vertical direction

The contact angle is set at 50 degrees, increasing load carrying capacity as well as rigidity in vertical direction.

6. High resistance against impact load

The bottom ball groove is formed in Gothic arch and the center of the top and bottom grooves are offset as shown in Fig. 2. The vertical load is generally carried by the top rows, at where balls are contacting at two points. Because of this design, the bottom rows will carry load when a large impact load is applied vertically as shown in Fig. 3. This assures high resistance to the impact load.

7. High accuracy

As showing in Fig. 4, fixing the master rollers is easy thanks to the Gothic arch groove. This makes easy and accurate measuring of ball grooves.

8. Fast delivery

Lineup of random-matching rails and ball slides supports and facilitates fast delivery.

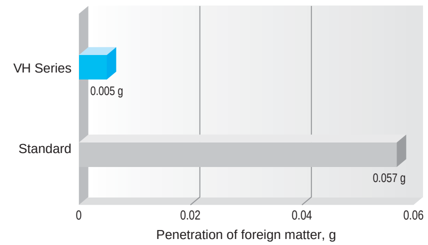
●Comparison with NSK standard products

Less than 1/10 the level of fine contaminants

Results of dust-proof tests reveal that the entry of fine contaminants is reduced to less than one-tenth of existing standard series due to improvements in sealing capability.

Specimen	: VH30AN
Speed	: 16.7 mm/sec
Foreign matter	: Graphite powder (average grain size: 0.037 mm) + Grease

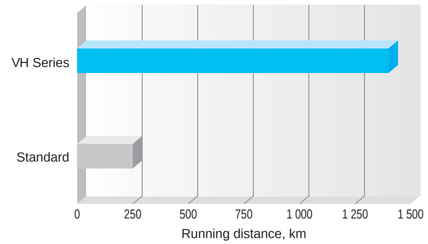


Opereting life under contaminated environments is more than 5 times longer

Durability test with rubber fragments

Extreme durability tests under contaminated environments using rubber fragments show that durability of the VH Series extended more than five times longer than the existing standard series, as shown in the graph.

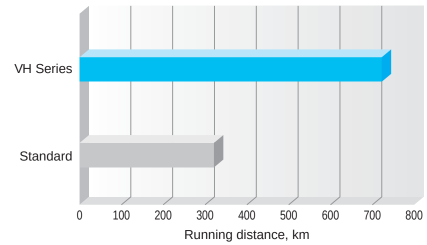
Specimen	: VH30AN, preload with Z1 (preload of 245 N)
Rail orientation	: Horizontal (wall mount)
Speed	: 500 mm/sec
Lubrication	: AS2 Grease (charged only at the beginning)
Foreign matter	: Rubber fragments

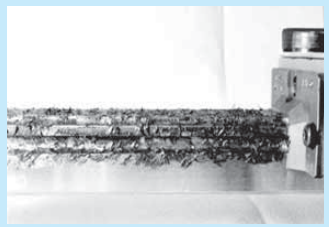


Durability test with fine wood particles

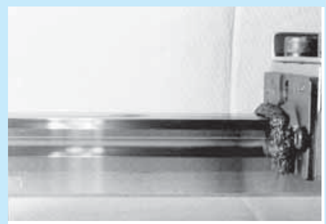
Extreme durability tests in a contaminated environment using fine wood particles show that durability of the VH Series is more than doubled compared to the standard series, as shown in the graph.

Specimen	: VH30AN (preload of 3 200 N)
Rail orientation	: Horizontal (wall mount)
Feed rate	: 400 mm/sec
Lubrication	: AS2 Grease (charged only at the beginning)
Foreign matter	: Fine wood particles





Before passage of ball slide
(Significant foreign matter remains)



After passage of ball slide
(All foreign matter is swept away)

3. Specification for tapped holes on a rail bottom surface

- Accuracy grades are precision grade (K6) and normal grades (KN and KC).
- Minimum rail length for production is 400 mm.
- Tapping pitch is the same as the pitch for regular mounting bolt holes. Please refer to the dimension table.

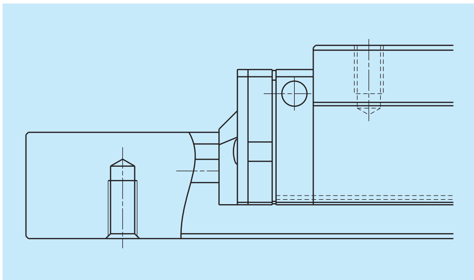

Fig. 11

(6) Lubrication components

Refer to page A38 and D13 for the lubrication of linear guides.

1. Types of lubrication accessories

Figure 12 and Table 10 show grease fittings and tube fittings.

We provide lubrication accessories with extended thread body length (L) for the addition of dust proof accessories such as NSK K1 lubrication unit, double seal and protector.

We provide a suitable lubrication accessory for the special requirement on dust proof accessories.

Consult NSK for a lubrication accessory with extended length of thread body for your convenience of replenishing lubricant.

Please ask NSK for stainless lubrication accessories.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of ball slide. We mount them on a side of end cap for an option. (Fig. 13)

Please consult NSK for installation of grease or tube fittings to the ball slide body or side of end cap.

When using a piping unit with thread of M6×1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

***) Only available for AN and BN type ball slides.

(7) Dust proof components

1. Standard specification

To keep foreign matters from entering inside the ball slide, VH Series has an end seal on both ends, and bottom seals at the bottom.
Two NSK K1, one at each end, are installed as standard equipment.

2. Double seal and protector

For VH Series, double-seal and protector can be installed only before shipping from the factory. Please consult NSK.

(8) Reference number

Reference numbers shall be set to individual NSK linear guide when its specifications are finalized, and it is indicated on its specification drawing.
Please specify the reference number, except design serial number, to identify the product when ordering, requiring estimates, or inquiring about specifications from NSK.

1. Reference number for preloaded assembly

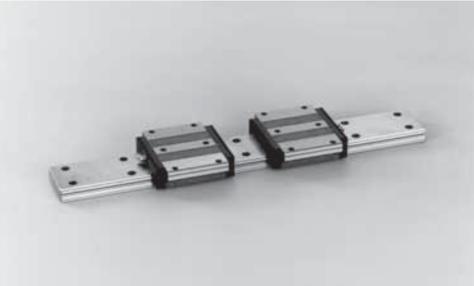
A-5-1.6 LW Series



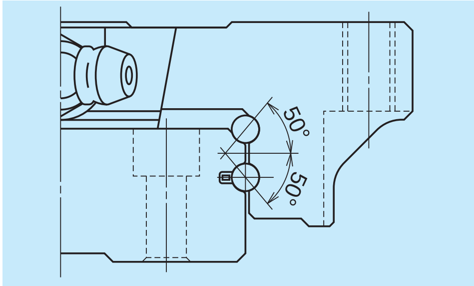


Fig. 1 Balls in contact

(1) Features

1. Ideal for use of single rail

Thanks to the wide rail, rigidity and load carrying capacity are high against moment load from rolling direction. This makes LW Series ideal in use of single rail as the linear guide.

2. High load carrying capacity to vertical direction

The contact angle is set at 50 degrees, increasing load carrying capacity as well as rigidity in vertical direction.

3. High resistance against impact load

Same as the LH and LS series, the offset Gothic arch grooves support a large load, such as an impact, by four rows.

4. High accuracy

Fixing master rollers is easy thanks to the Gothic arch groove. This makes easy and accurate measuring of ball grooves.

5. Easy to handle, and designed with safety in mind.

Balls are retained in the retainer and do not fall out when a ball slide is withdrawn from the rail.

6. Fast delivery

Lineup of random-matching rails and ball slides supports and facilitates fast delivery.

(2) Ball slide shape

2. Accuracy standard

The preloaded assembly has three accuracy grades; High precision P5, Precision P6, and Normal PN grades, while the random-matching type has Normal PC grade.

• Tolerance of preloaded assembly type

5. Preload and rigidity

We offer five levels of preload: slight preload Z1, medium preload Z3 and fine clearance Z0, along with random-matching type of fine clearance ZT and slight preload ZZ. Values for preload and rigidity of the preloaded assembly are shown in Table 5. Rigidities are for the median of the preload range.

- **Preload and rigidity of preloaded assembly**

Note: Clearance for fine clearance Z0 is 0 to 3μm. Therefore, preload is zero.
However, Z0 of PN grade is 0 to 15μm.

Note: Minus sign denotes that a value is an amount of preload (elastic deformation of balls).

(4) Available length of rail

- Table 7 shows the limitations of rail length (maximum length). However, the limitations vary by accuracy grade.

Refer to page A38 and D13 for the lubrication of linear guides.

1. Types of lubrication accessories

Figure 11 and Table 10 show grease fittings and tube fittings.

We provide lubrication accessories with extended thread body length (L) for the addition of dust proof accessories such as NSK K1 lubrication unit, double seal and protector.

We provide a suitable lubrication accessory for the special requirement on dust proof accessories.

Consult NSK for a lubrication accessory with extended length of thread body for your convenience of replenishing lubricant.

Please ask NSK for stainless lubrication accessories.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of ball slide. We mount them on a side of end cap for LW27, 35, and 50 as an option. (Fig. 8)

Please consult NSK for installation of grease or tube fittings to the ball slide body or side of end cap.

When using a piping unit with thread of M6 × 1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

(7) Dust proof components

1. Standard Specification

To keep foreign matters from entering inside the ball slide, LW Series has an end seal on both ends, and bottom seals at the bottom.

3. Double seal

Use a double seal set as showing in Table 13, when installing an extra seal to completed standard products. (Fig. 10)

When installing a grease fitting after the installation of double seals, a connector is required.

· While removing machine screws which secure the end seal to install the bellows to the slide, for LW17 and 21, hold the end cap by hand not to be detached from the slide.

· Make tap holes to the rail end face to fix the bellows mounting plate. NSK processes tap holes to the rail end face when ordered with a linear guide.

When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26.

A-5-1.7 TS Series

(1) Features

1. Inexpensive

Newly developed manufacturing process of rail, and design review of ball slide contribute to substantial cost reductions.

2. High capacity

Optimum ball diameter for higher capacity design.

3. High dust proof capability

Dust-tight high performance end seals, bottom seals, and inner seals are built-in as a standard feature. (Optional protector is available for protection against hot debris such as welding spatters or hard contamination.)

4. Maintenance free

NSK K1 lubrication unit is equipped as a standard specification for long-term maintenance-free operation.

5. Rust prevention

NSK provides a lineup of products with antirust surface treatment for corrosive environments.

6. Fast delivery

Lineup of random-matching rails and ball slides supports and facilitates fast delivery.

(2) Ball slide shape

Ball slide Model	Shape / installation method	Type

(3) Accuracy and preload

Accuracy grade: Normal grade for transportation
Torelance of mounting height *H*: ±0.1 mm
Running parallelism: 100 µm or less
Running parallelism (height): 500 µm/500 mm
Clearance: 60 µm or less

(4) Available length of rail

Table 1 shows the limitations of rail length (maximum length).

Table 1 Length limitations of rails

Note: Rails can be butted if user requirement exceeds the rail length shown in the Table. Please consult NSK.
*)The maximum length of fluoride low temperature chrome plated products is 4 000 (G = 80).

(5) Lubrication components

Refer to page A38 and D13 for the lubrication of linear guides.

1. Types of lubrication accessories

Figure 2 and Table 2 show grease fittings and tube fittings.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of ball slide. We mount them on a side of end cap for an option. (Fig. 2)
Please consult NSK for installation of grease or tube fittings to the ball slide body or side of end cap.
When using a piping unit with thread of M6 × 1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

(6) Dust proof components

1. Standard specification

To keep foreign matters from entering inside the ball slide, TS series has an end seal and NSK K1 on both ends, and bottom seals at the bottom. Also, the inner seal is a standard equipment.

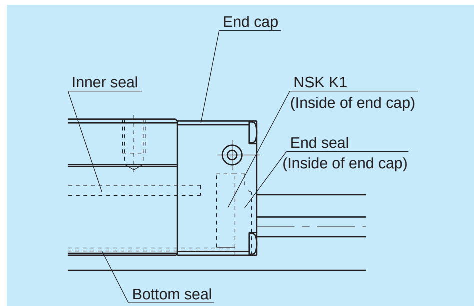

Fig. 3

2. Protector

It is possible to mount a protector to TS series as an option.
Please consult NSK as the protector for TS series can be installed only before shipping from the factory.

2) The basic dynamic load rating C is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface. To convert C to C100 for a 100 km fatigue life, divide C by 1.26.

3) Consult with NSK when using a TS series in a single rail configuration.

A-5-2.1 RA Series

(1) Features

1. Super-high load capacity

By installing rollers that are the largest possible diameter and length within the existing standard cross-section dimension in a rational layout based on analysis technology, we have realized the world's highest load capacity,* far superior to conventional roller guides. Super-long life is achieved and impact load can be sufficiently handled.

* Compared with products of the same size, as of September 1, 2003, researched by NSK.

2. Super-high rigidity

Using NSK's advanced analysis technology, we pursued a complete, optimal design, down to the detailed shape of roller slides and rails, thereby realizing super-high rigidity superior to that of competitor's roller guides.

3. Super-high motion accuracy

NSK has developed its own unique method of simulating rolling element passage vibration and method of designing optimal roller slide specifications for damping roller passage vibration. These developments have dramatically enhanced roller slide motion accuracy for the RA series.

4. Smooth motion

Installing a retaining piece between rollers and restraining the skew peculiar to roller bearings achieve smooth motion.

5. Low friction

Using rollers for rolling elements helps minimize dynamic friction.

6. Fast delivery

Lineup of random-matching rails and roller slides supports random matching and facilitates fast delivery. (RA25 to RA65)

2. Accuracy standard

The preloaded assembly has four accuracy grades; Ultra precision P3, Super precision P4, High precision P5, and Precision P6 grades, while the random-matching type has Precision P6 grade.

• Tolerance of preloaded assembly

4. Preload and rigidity

Preload is set for the RA series by slightly changing the size of the roller used. Applying preload enhances rigidity and minimizes elastic deformation.

With the characteristics of the roller guide, there is minimal variation in rigidity according to amount of preload, and it offers stable, high rigidity. Because of that, for the RA series, only medium preload type Z3 (preload: 10% of C, where C is the basic dynamic load rating) is set.

Preload is shown in Table 4, and theoretical rigidity lines are shown in Fig. 6 and Fig. 7.

(6) Lubrication components

Refer to page A38 and D13 for the lubrication of linear guides.

1. Types of lubrication accessories

Figure 14 and Table 10 show grease fittings and tube fittings.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of roller slide. We mount them on a side of end cap for an option. (Fig. 12) Mounting positions are shown in Fig.12, 13, Table 8 and 9.

Please consult NSK for installation of grease or tube fittings to the roller slide body or side of end cap.

When using a piping unit with thread of M6×1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

A lubrication hole can also be provided on the top of the end cap. Fig.13, Table 8 and 9 show the mounting position.

A spacer is required for AN and BN type of roller slides.

1. Standard specification

RA series is equipped with end, inner* and bottom seals to prevent foreign matter from entering the inside of the roller slide. Under normal applications, the RA series can be used without modification.

For severe usage conditions, optional rail covers** are available. Contact NSK for information on how to mount the cover.

*) Inner seals for RA15 and RA20 are available as options.

**) Rail cover is applicable to RA25 to RA65.

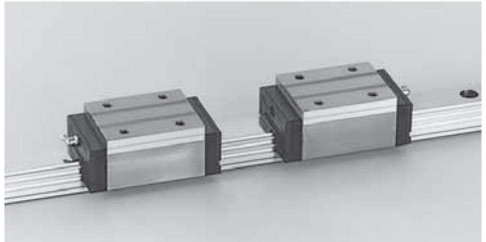
A-5-2.2 LA Series



(1) Features

1. High rigidity and high load carrying capacity

A set of three ball grooves is made on both sides. This contributes to the increased rigidity and load carrying capacity. The top and bottom groove are formed in the circular arc with a closer radius of ball, which ensures great rigidity and load carrying capacity. With the Gothic arch center groove, rigidity and load carrying capacity are further increased.

2. Moderate friction

A well-balanced combination of 2-point contacts at the top and bottom grooves and 4 points contact at the center groove provides moderate friction while ensuring rigidity by appropriate preload.

3. Load distribution four directions

Contact angle is set at 45 degrees in all grooves, dispersing the load to four rows irrespective of load direction. This realizes equal rigidity and load carrying capacity in vertical and lateral directions and provides well-balanced design.

4. Strong against shock load

Load from any direction, vertical and lateral, is received by four rows at all times. The number of rows which receive the load is larger than in other linear guides, making this series stronger against shock load.

5. High accuracy

Fixing the measuring rollers is easy thanks to the Gothic arch groove. Ball-groove measuring is accurate and simple. This benefits a highly precise and stable manufacturing.

6. The dust protection design

The rail's cross section is designed as simple as possible. Furthermore, the improved seal enhances the sealing function. Inner seal is available as an option.

(6) Lubrication components

Refer to page A38 and D13 for the lubrication of linear guides.

1. Types of lubrication accessories

Figure 10 and Table 7 show grease fittings and tube fittings.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of ball slide. We mount them on a side of end cap for an option. (Fig. 11) .

Please consult NSK for installation of grease or tube fittings to the ball slide body or side of end cap.

When using a piping unit with thread of M6×1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

1. Standard Specification

To keep foreign matters from entering inside the ball slide, LA Series has an end seal on both ends, and bottom seals at the bottom.

Inner seal is available as an option.

Note [(1)] Bellows for LA65 is for both low and high types.

Remarks : Values of odd number BLs are obtained by adding values of the even number BLs on both sides, then dividing the sum by two.

(8) Reference number

Reference numbers shall be set to individual NSK linear guide when its specifications are finalized, and it is indicated on its specification drawing.
Please specify the reference number, except design serial number, to identify the product when ordering, requiring estimates, or inquiring about specifications from NSK.

Remarks: 1) LA Series does not have a ball retainer. Be aware that balls fall out when the ball slide is withdrawn from the rail.

2) The basic dynamic load rating is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface.
When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26.

Remarks: 1) LA Series does not have a ball retainer. Be aware that balls fall out when the ball slide is withdrawn from the rail.

2) The basic dynamic load rating is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface.
When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26.

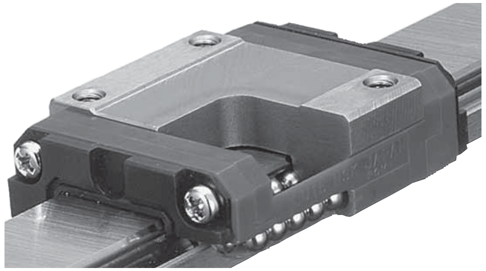
A-5-3.1 PU Series (Miniature type)



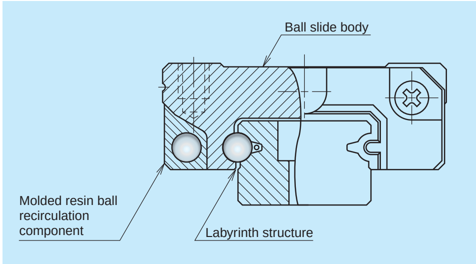


Fig. 1

(1) Features

1. Motion performance

Newly designed recirculation component facilitates smooth circulation of steel balls.

2. Lightweight

The ball slide is fabricated to be approximately 20% lighter than LU Series by the application of resin to a part of its body.

3. Reduced noise intensity

Resin components applied in ball circulating circuits reduce collision noise between steel balls and the inner wall of circulating circuits.

4. Low dust generation

The structure of the ball slide is designed to prevent dust generation.

5. Excellent dust-proofing

The labyrinth structure adopted for the side of the rails and the inner walls of the ball slide allows effects equivalent to a bottom seal.

6. High corrosion resistance

High corrosion-resistant martensite stainless steel incorporated as a standard feature provides excellent resistance to corrosion.

7. Easy to handle

Safety design includes a retainer that prevents steel balls from dropping out of the ball slide even when the slide is removed from the rail.

8. Long-term maintenance-free

Equipped with NSK K1 Lubrication unit realizes long-term, maintenance-free use.

9. Fast delivery

Lineup of random-matching rails and ball slides in the series supports random matching and facilitates fast delivery. (PU09 to PU15)

2. Accuracy standard

The preloaded assembly types products have four accuracy grades; Super precision P4, High precision P5, Precision grade P6, and normal grade PN, while the random-matching type has a normal grade PC.
Table 2 shows the accuracy standard for the preloaded assembly type while Table 3 shows the accuracy standard for the random-matching types.

• Tolerance of preloaded assembly

3. Assembled accuracy

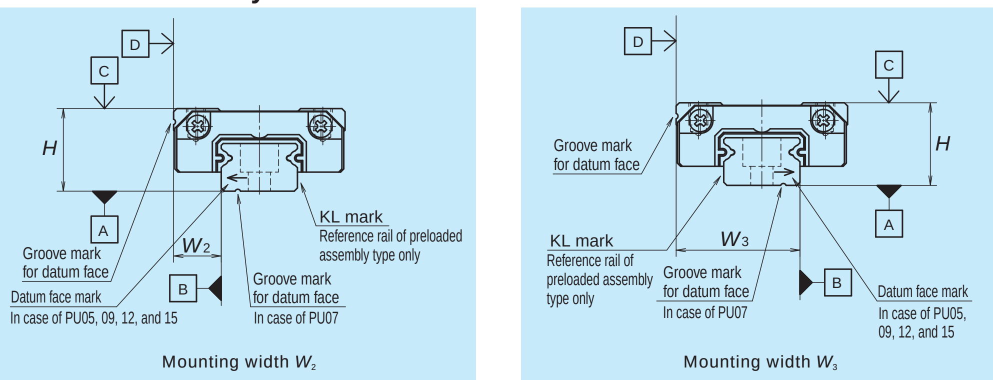

Fig. 2

Note: Please refer to page A67 for marks on the datum faces.

4. Preload and rigidity

We offer three levels of preload: Slight preload Z1 and Fine clearance Z0, along with random-matching type of Fine clearance ZT. Values for preload and rigidity of the preloaded assembly type are shown in Tables 4. Rigidities are for the median of the preload range.

• Preload and rigidity of preloaded assembly

Table 4

	Model No.	Preload (N) Slight preload (Z1)	Rigidity (N/µm) Slight preload (Z1)

High-load type	PU09UR	0 – 14	46
	PU12UR	0 – 25	52
	PU15BL	0 – 51	75

Note: Clearance of fine clearance Z0 is 0 to 3 µm. Therefore, preload is zero.
However, Z0 of PN grade is 3 to 10 µm.
Clearance values of the random-matching type are shown in Tables 5.

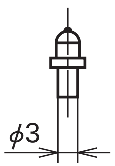
(6) Lubrication accessory

PU15 can select drive-in type grease fitting as an option.
For PU05 to PU12, apply grease directly to the ball grooves of rail using a point nozzle.



Drive-in type

(7) Dust proof components

1. Standard specification

End seal: Provided to both ends of the ball slide as a standard feature.
Bottom seal function: A labyrinth structure of the ball slide bottom face functions as sealing effect.

Seal friction per standard ball slide is shown in Table 9.

(1) Features

1. Motion performance

Newly designed recirculation component facilitates smooth circulation of steel balls.

2. Lightweight

The ball slide is fabricated to be approximately 20% lighter than LE Series by the application of resin to a part of its body.

3. Reduced noise intensity

Resin components applied in ball circulating circuits reduce collision noise between steel balls and the inner wall of circulating circuits.

4. Low dust generation

The structure of the ball slide is designed to prevent dust generation.

5. Excellent dust-proofing

The labyrinth structure adopted for the side of the rails and the inner walls of the ball slide allows effects equivalent to a bottom seal.

6. High corrosion resistance

High corrosion-resistant martensite stainless steel incorporated as a standard feature provides excellent resistance to corrosion.

7. Easy to handle

2. Accuracy standard

The preloaded assembly types products have four accuracy grades; Super precision P4, High precision P5, Precision P6, and Normal PN grades, while the random-matching type has Normal PC grade.
Table 2 shows the accuracy standard for the preloaded assembly type while Table 3 shows the accuracy standard for the random-matching types.

• Tolerance of preloaded assembly

Table 2 Unit: μm

Characteristics \ Accuracy grade	Super precision P4	High precision P5	Precision grade P6	Normal grade PN

4. Preload and rigidity

We offer three levels of preload: Slight preload Z1 and Fine clearance Z0, along with random-matching type of Fine clearance ZT. Values for preload and rigidity of the preloaded assembly types are shown in Tables 4. Rigidities are for the median of the preload range.

Table 4 Preload and rigidity of preloaded assembly

	Model No.	Preload (N) Slight preload (Z1)	Rigidity (N/μm) Slight preload (Z1)
Standard type	PE05AR	0 – 28	45

High-load type	PE09UR	0 – 54	86
	PE12BR	0 – 59	97
	PE15BR	0 – 75	114

Note: Clearance of fine clearance Z0 is 0 to 3 μm. Therefore, preload is zero.
However, Z0 of PN grade is 3 to 10 μm.
Clearance values of the random-matching types are shown in Tables 5.

(6) Lubrication accessory

PE15 can select drive-in type grease fitting as an option.
For PE05 to PE12, apply grease directly to the ball grooves of rail using a point nozzle.

Remarks: 1) Ball slide of PE05AR has only two mounting tap holes in the center.

2) The basic dynamic load rating is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface.
When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26.

3) To fix rail of PE05AR, use M2.5 x 0.45 cross-recessed pan head machine screw for precision instrument.

(JCIS : Japanese Camera Industrial Standard.)

A-5-3.3 LU Series (Miniature type)

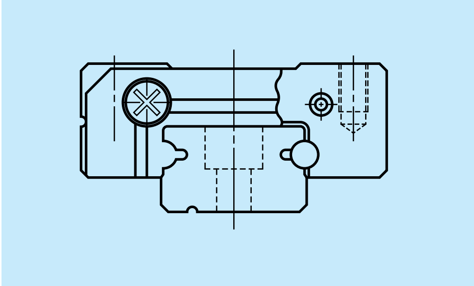

Fig. 1 LU Series

(1) Features

1. Super-small type

This compact guide owes its design to the single ball groove on both right and left sides (Gothic arch) .

2. Equal load carrying capacity in vertical and lateral directions

Contact angle is set at 45 degrees, equally load carrying capacity in vertical and lateral directions. This also provides equal rigidity in both directions.

3. Stainless steel is also standardized

Items made of the martensitic stainless steel are available as standard.

4. Some series have a ball retainer

Ball slide types AR and TR come with a ball retainer. Balls are retained in the retainer and do not fall out when the bearing is withdrawn from the rail. (Ball slides of random-matching parts as well as LU15 come with ball retainer.)

5. Fast delivery

The series enables random matching of rails and ball slides for prompt delivery. (LU09 to LU15)

2. Accuracy standard

The preloaded assembly types products have four accuracy grades; Super precision P4, High precision P5, Precision P6, and Normal PN grades, while the random-matching type has Normal PC grade.

Table 2 shows the accuracy standard for the preloaded assembly type while Table 3 shows the accuracy standard for the random-matching types.

• Tolerance of preloaded assembly

3. Assembled accuracy

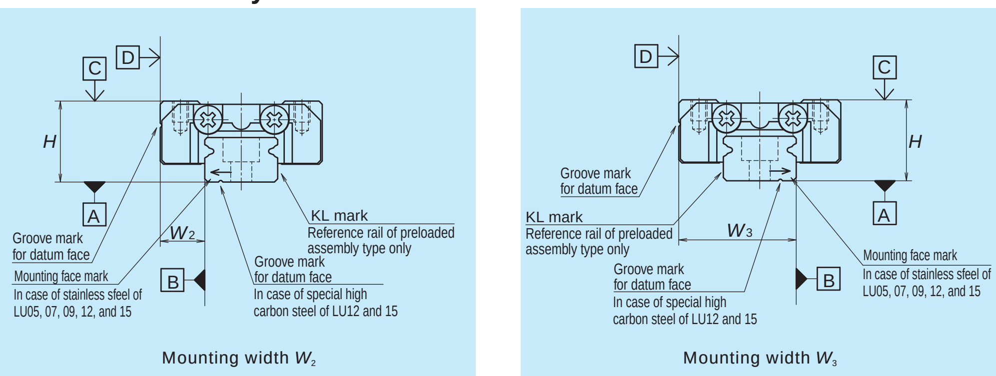

Fig. 3

Note: Please refer to page A67 for marks on the datum faces.

4. Preload and rigidity

We offer three levels of preload: Slight preload (Z1) and Fine clearance (Z0), along with random-matching type of Fine clearance (ZT). Values for preloaded and rigidity of the preloaded assembly type are shown in Table 4. Rigidities are for the median of the preload range.

• Preload and rigidity of preloaded assembly

Table 4

	LU12 BL, UL	0 – 25	52
	LU15 BL	0 – 51	75

Note: Clearance of fine clearance Z0 is 0 to 3 µm. Therefore, preload is zero.
However, Z0 of PN grade is 3 to 10 µm.
Clearance values of the random-matching type are shown in Table 5.

(6) Lubrication accessories

There is no standard grease fitting for LU05 to LU15.

For LU Series, apply grease directly to ball groove, etc. using a point nozzle.

(7) Dust proof components

1. Standard specification

End seal: Provided to both ends of the ball slide as a standard feature.
LU05TL, LU07AL, LU09AL, and LU09TL can install as an option.

Remarks 1) LU05TL, LU07AL, LU09TL, LU09AR, LU09TR, LU12AR and LU12TR come in stainless steel only.
2) Ball slide of LU05TL has only two mounting tap holes in the center.
3) End seals of LU05TL, LU07AL, LU09AL and LU09TL are available on request.

4) To fix rail of LU05TL, use M2 x 0.4 cross-recessed pan head machine screw for precision instrument.
(JCIS 10-70 No. 0 pan head machine screw No.1.)
(JCIS : Japanese Camera Industrial Standard.)
5) The basic dynamic load rating is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface. When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26.

Remarks 1) LU09UL is available only in stainless steel.
2) LU15BL is equipped with ball retainer.

3) The basic dynamic load rating is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface. When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26.

A-5-3.4 LE Series
(Miniature type)

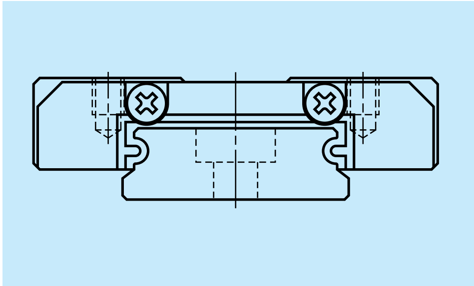

Fig. 1 LE Series

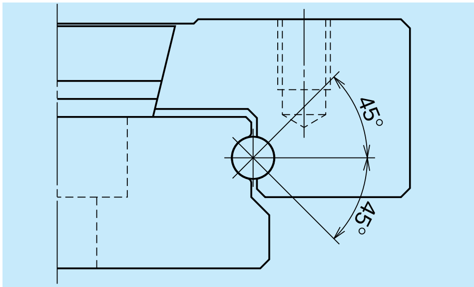

Fig. 2 Balls in contact

(1) Features

1. Ideal for use of single rail

LE Series linear guides are miniature and wide rail type. Thanks to the wide rail, load carrying capacity is high against moment load from rolling direction.

2. Equal load carrying capacity in vertical and lateral directions

Contact angle is set at 45 degrees, equally dispersing the load from vertical and lateral directions. This also provides equal rigidity in the two directions.

3. Guides are super-thin.

Super-thin guides owe their design to the single ball groove on right and left sides (Gothic arch).

4. High accuracy

Fixing the master rollers is easy thanks to the Gothic arch groove. Groove measuring is accurate and easy.

5. Stainless steel is standard.

Rails and ball slides are made of martensitic stainless steel.

6. Ball retainer is available in some series.

Some series come with a ball retainer (ball slide model: AR and TR). Balls are retained in the retainer and do not fall out when a ball slide is withdrawn from the rail (random-maching ball slides come with a ball retainer).

7. Fast delivery

The series enables random matching of rails and ball slides (interchangeability) for prompt delivery. (LE09 to LE15)

(2) Ball slide shape

Ball slide Model	Shape/installation method	Type		
		Medium-load type	Standard type	High-load type

* Only applicable to LE09

(3) Accuracy and preload

1. Runing parallelism tolerance

Table 1

Unit: µm

2. Accuracy standard

The preloaded assembly types products have three accuracy grades; High precision P5, Precision P6, and Normal PN grades, while the random-matching type has Normal PC grade.
Table 2 shows the accuracy standard for the preloaded assembly type while Table 3 shows the accuracy standard for the random-matching types.

• Tolerance of preloaded assembly

Table 2 Unit: µm

Characteristics \ Accuracy grade	High precision P5	Precision grade P6	Normal grade PN
Mounting height *H* Variation of *H* (All ball slides on a set of rails)	±15 7	±20 15	±40 25
Mounting width W_2 or W_3 Variation of W_2 or W_3 (All ball slides on reference rail)	±20 10	±30 20	±50 30
Running parallelism of face C to face A Running parallelism of face D to face B	Refer to Table 1 and Fig. 3		

• Tolerance of random-matching type: Normal grade, PC

Table 3 Unit: µm

3. Assembled accuracy

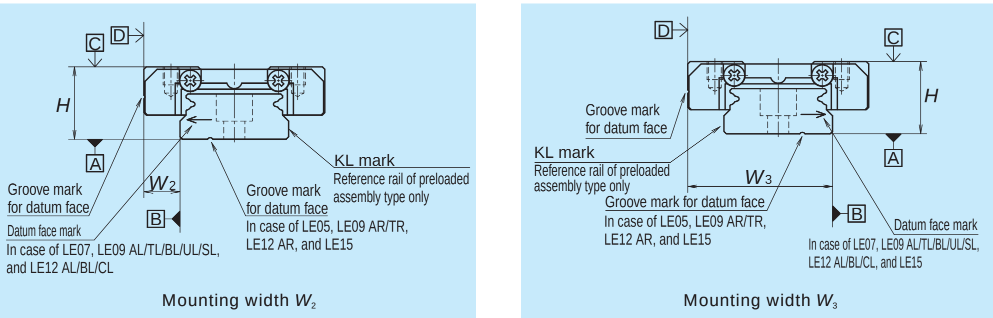

Fig. 3

4. Preload and rigidity

We offer three levels of preload: Slight preload (Z1) and Fine clearance (Z0), along with random-matching type of Fine clearance (ZT). Values for preloaded and rigidity of the preloaded assembly type are shown in Table 4. Rigidities are for the median of the preload range.

• Preload and rigidity of preloaded assembly

Table 4

	Model No.	Preload (N) Slight preload (Z1)	Rigidity (N/µm) Slight preload (Z1)

	LE09 BL, UL	0 – 54	86
	LE12 BL	0 – 59	97
	LE15 BL	0 – 75	114

Note: Clearance of fine clearance Z0 is 0 to 3 µm. Therefore, preload is zero.
However, Z0 of PN grade is 3 to 10 µm.
Clearance values of the random-matching type are shown in Table 5.

(4) Available length of rail

Table 6 shows the limitations of rail length (maximum length).
However, the limitations vary by accuracy grade.

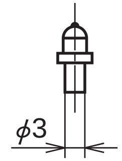
(6) Lubrication accessories

LE15 AR can select drive-in type grease fitting as option.
There is no standard grease fitting for LE05 to 12.
For LE05 to 15, apply grease directly to ball groove, etc. using a point nozzle.



Drive-in type

(7) Dust proof components

1. Standard specification

End seal: Provided to both ends of the ball slide as a standard feature.

• Seal friction per standard ball slide is shown in Table 9.

Remarks: 1) Ball slide of CL and SL types have only two mounting tap holes in the center.

2) The basic dynamic load rating is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface. When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26

3) For fixing a rail of LE05CL, use cross-recessed pan head machine screw for precision instruments M2.5x0.45 (JCIS 10-70 : Japan Camera Industry Association, No.0, class 3).

A-5-3.5 LL Series

(1) Features

1. Super light-weight

This compact guide has a single ball groove on both right and left sides (Gothic arch). Rails and ball slides are made of stainless steel plate, therefore they are lightweight.

2. Compact

The ball groove is made outside the ball slide to reduce overall size and to obtain high speed.

3. High corrosion resistance

High corrosion resistant martensitic stainless steel is used as standard material.

A-5-4 High-Precision Machine and High-Precision Measuring Equipment

A-5-4.1 HA Series

(1) Features

1. High motion accuracy

High motion accuracy is achieved in both narrow and wide ranges by adopting ultra-long ball slides and optimum design features for the ball recirculation component.

2. Ball passage vibration reduced to one-third of our conventional models

Tests show ball passage vibration has been reduced to one-third of our conventional models, dramatically improving straightness in table unit.

3. Installation of rail with greater accuracy

Increased counterbore depth of the rail mounting hole reduces rail deflection, which is caused by bolt tightening when fixing the rail to the base component, to 50% or less. This feature restrains the pitching motion of ball slide whose frequency matches to the mounting hole pitch.

In addition, the length of mounting hole pitch has been reduced by one-half of the conventional models, so the rail can be more accurately installed in position.

4. High rigidity and load capacity with lower friction

High rigidity, high load capacity and low friction are achieved by increasing the number of balls.

5. Compact design

Reduced body size enables more compact machinery.

6. Load distribution four directions

Contact angle is set at 45 degrees in all grooves, dispersing the load to four rows irrespective of load direction. This realizes equal rigidity and load carrying capacity in vertical and lateral directions and provides well-balanced design.

7. Strong against shock load

Load from any direction, vertical and lateral, is received by four rows at all times. The number of the row which receives the load is larger than in other linear guides, making this series stronger against shock load.

8. High accuracy at manufacturing

Fixing the measuring rollers is easy thanks to the Gothic arch groove. Ball-groove measuring is accurate and simple. This benefits a highly precise and stable manufacturing.

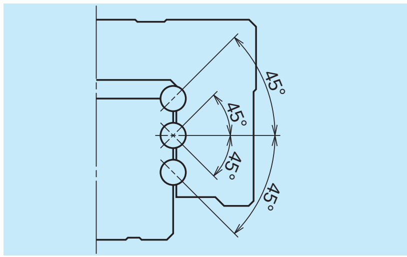

Fig. 2 Super rigidity design

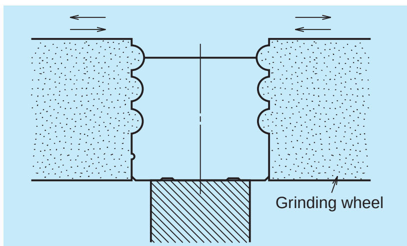

Fig. 3 Rail grinding

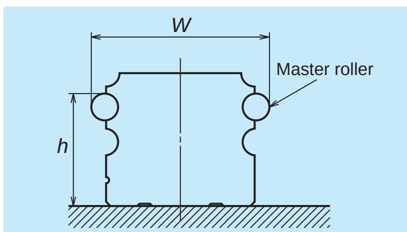

Fig. 4 Measuring groove accuracy

Measurement results of ball passage vibration

Ball passage vibration can translate into posture changes in the ball slide which result from ball passage (circulation). In the HA Series, this vibration has been substantially reduced to one-third of conventional models.

(6) Lubrication components

Refer to Page A38 and D13 for linear guide lubrication.

1. Types of lubrication accessories

Figure 12 and Table 7 show grease fittings and tube fittings.

We provide lubrication accessories with extended thread body length (L) for the addition of dust proof accessories such as NSK K1 lubrication unit, double seal and protector.

We provide a suitable lubrication accessory for the special requirement on dust proof accessories.

Consult NSK for a lubrication accessory with extended length of thread body for your convenience of replenishing lubricant.

Please ask NSK for stainless lubrication accessories.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of ball slide. We mount them on a side of end cap for an option. (Fig. 13)

Please consult NSK for installation of grease or tube fittings to the ball slide body or side of end cap.

When using a piping unit with thread of M6×1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

Remarks: 1) HA Series does not have a ball retainer. Be aware that the balls fall out when a bearing is withdrawn from the rail.

2) The basic dynamic load rating is a load that furnishes 50 km rating fatigue life; it is a vertical and constant load to the ball slide mounting surface. When converting the basic dynamic load rating C to the dynamic load rating C_{100} for 100 km rating fatigue life, divide the C by 1.26.

A-5-4.2 HS Series

(1) Features

1. High motion accuracy

High motion accuracy is achieved in both narrow and wide ranges by adopting ultra-long ball slides and optimum design features for the ball recirculation component.

2. Ball passage vibration reduced to one-third of our conventional models

Tests show ball passage vibration has been reduced to one-third of our conventional models, dramatically improving straightness in table unit.

3. Installation of rail with greater accuracy

Increased counterbore depth of the rail mounting hole reduces rail deflection, which is caused by bolt tightening when fixing the rail to the base component, to 50% or less. This feature restrains the pitching motion of ball slide whose frequency matches to the mounting hole pitch.

In addition, the length of mounting hole pitch has been reduced by one-half of the conventional models, so the rail can be more accurately installed in position.

4. High rigidity and load capacity with lower friction

High rigidity, high load capacity and low friction are achieved by increasing the number of balls.

5. Compact design

Reduced body size enables more compact machinery.

6. High load carrying capacity to vertical direction

The contact angle is set at 50 degrees, increasing load carrying capacity as well as rigidity against the load in vertical direction.

7. High resistance against impact load

The bottom ball groove is formed in Gothic arch and the center of the top and bottom grooves are offset as shown in Fig. 2. The vertical load is usually carried by top 2 rows at where balls are contacting at two points. Because of this design, the bottom rows will carry the load when a large impact load is applied as shown in Fig. 3. This assures high resistance to the impact load.

8. High accuracy at manufacturing

As showing in Fig. 4, fixing the measuring rollers is simple thanks to the Gothic arch groove. This makes easy and accurate measuring of ball grooves.

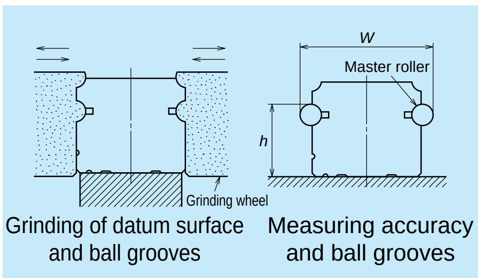

Fig. 4 Rail-grinding and measuring

Measurement results of ball passage vibration

Ball passage vibration can translate into posture changes in the ball slide which result from ball passage (circulation). In the HS Series, this vibration has been substantially reduced to one-third of conventional models.

(6) Lubrication components

Refer to Page A38 and D13 for linear guide lubrication.

1. Types of lubrication accessories

Figure 12 and Table 7 show grease fittings and tube fittings.

We provide lubrication accessories with extended thread body length (L) for the addition of dust proof accessories such as NSK K1 lubrication unit, double seal and protector.

We provide a suitable lubrication accessory for the special requirement on dust proof accessories.

Consult NSK for a lubrication accessory with extended length of thread body for your convenience of replenishing lubricant.

Please ask NSK for stainless lubrication accessories.

2. Mounting position of lubrication accessories

The standard position of grease fittings is the end face of ball slide. We mount them on a side of end cap for an option. (Fig. 13)

Please consult NSK for installation of grease or tube fittings to the ball slide body or side of end cap.

When using a piping unit with thread of M6×1, you require a connector to connect to a grease fitting mounting hole with M6 × 0.75. The connector is available from NSK.

A-6 Other Linear Rolling Guide Products

A-6-1 Linear Rolling Bushing

(1) Features

1. Low friction

Low friction owes to its design: Balls come into point contacts with raceway surface: the balls smoothly re-circulate. There is very little stick slip.

2. Low noise

Noise level is low due to the ball retainer which is made of a synthetic resin.

3. High precision

Due to NSK's superb quality control, precision is guaranteed.

4. Dust prevention

Series with seal is available. The seal has small friction, and is highly durable. Highly dust-preventive double-lip system has been adopted.

5. Superb durability

The material of outer sleeve is vacuum degassed, highly pure, and is heat-treated with good expertise.

(2) Models

There are three models

1. Standard type LB (Fig. 1)

This model is the most commonly used, and is the only model that comes with a seal and in super precision grade.

Fig. 1 Standard type LB

2. Adjustable clearance type LB-T (Fig. 2)

A part of the outer sleeve is cut open toward the axial direction. Used with a housing which can adjust inside diameter, it makes minute adjustment of the clearance between the linear shaft and the inscribed circle (an imaginary circle that connects the summit of the ball) of linear rolling bushing.

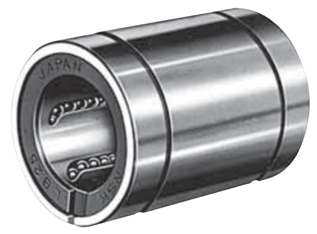

Fig. 2 Adjustable Clearance type LB-T

3. Open type LB-K (Fig. 3)

A cut is made in the outer sleeve and retainer, to a width equivalent to one row of the retainer, to the axial direction. The opening is used to hold this linear rolling bushing by a support or base to prevent a long linear shaft from bending.

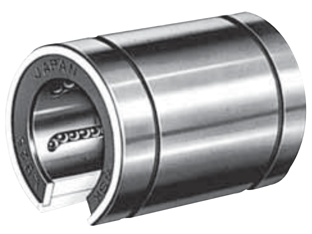

Fig. 3 Open type LB-K

(5) Lubrication and Friction

1. Grease lubrication

① Supply at initial stage

At time of delivery, the linear rolling bushing has a coat of rust preventive agent. Wipe it off with clean kerosene or organic solvent. Dry with an air blower, etc., then apply grease.

Lithium soap based greases with consistency level of 2 are generally used (e.g. NSK Grease LR3, PS2, and AS2).

② Replenishment

- Sealed linear rolling bushing is designed to be a disposal item. Therefore, a replenishing grease is considered to be not required. However, if replenishment becomes necessary due to dirty environment or wear of the seal, remove the linear bushing from the shaft and replenish lubricant in the same manner as the initial lubricating.
- For items without seal, wipe off old grease from the linear shaft, and apply new grease.
- Intervals of replenishments are every 100 km in a dirty environment, 500 km in a slightly dirty environment, 1000 km or no replenishing for a normal environment.

2. Oil lubrication

It is not necessary to wash off the rust preventive agent applied before delivery.

Use an oil of ISO viscosity grade VG15-100. Drip the oil on the linear shaft by an oil supply system.

Temperature to use

−30°C to 50°C Viscosity VG15 – 46

50°C to 80°C Viscosity VG46 – 100

Lubricant is removed by the seal if the linear ball bearing has a seal. Therefore, the drip method cannot be used except for single-seal types.

3. Friction coefficient

The linear rolling bushing has a small dynamic friction coefficient. This contributes to low power loss and temperature rise.

Fig. 4 indicates dynamic friction coefficient is merely 0.001-0.004. Also, at the speed of under 60 m/min, there is no danger of the temperature rising.

Friction force can be obtained by the following formula.

$$F = \mu \cdot P \quad \cdots\cdots (1)$$

In this formula:

F : Friction force (N)

P : Load (vertical load to the shaft center line) (N)

μ : Friction coefficient (dynamic or static)

For a seal type, a seal resistance of 0.3 to 2.40 N is added to the above.

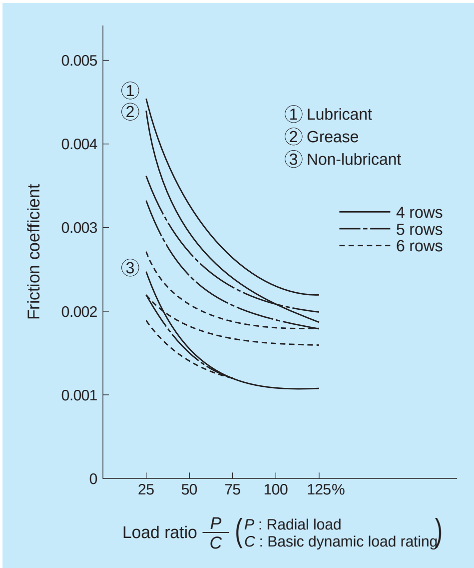

Fig. 4 Dynamic friction coefficient of linear rolling bushing

(6) Range of Conditions to Use

Generally, use under the following conditions.

Please consult NSK when values exceed the ranges given below.

Temperature········Minus 30°C to plus 80°C

Speed·················Up to 120 m/min

(excluding oscillation and short strokes)

(7) Preload and Rigidity

The linear rolling bushing is normally used without applying preload. If high positioning accuracy is required, set the clearance between the linear rolling bush and the shaft at the range of 0 to 5 µm. Slight preload is a general rule (1% of basic dynamic load rating C -- see the dimension table).

The dimension table shows theoretical rigidity K when clearance with the shaft is zero, and a load of 0.1 C is applied to the summit of the ball.

Rigidity K_N, when load is not 0.1 C, is obtained by the following formula.

$$K_N = K\,(P/0.1C)^{1/3} \quad \cdots\cdots (2)$$

In this formula:

K : Rigidity value in the dimension table (N/μ m)

P : Radial load (N)

When the load is applied between the ball raws, the load becomes 1.122 times for 4 ball rows; 0.959 times for 5 ball rows; 0.98 times for 6 ball rows.

(8) Basic Load Rating and Rated Life

1. Basic dynamic load rating

Basic dynamic load rating C is: A radial load which allows 90% of a group of linear rolling bush to run a distance of 50 km without suffering damage when they are moved individually.

There is a relationship as below between C and the life

$$L = 50\, f_L^{\,3} \quad \cdots\cdots (3)$$

$$f_L = C/P \quad \cdots\cdots (4)$$

In this formula:

L : Rated life (km)

P : Radial load (N)

f_L : Life factor (Refer to Fig. 5)

This formula is used provided that the shaft hardness is HRC58 or higher. Rated life is shorter if the shaft is softer. In this case, find the hardness factor f_H from Fig. 6, and multiply the value.

$$f_L = C \cdot f_H/P \quad \cdots\cdots (5)$$

Or

$$C = P \cdot f_L/f_H \quad \cdots\cdots (6)$$

Life in time can be obtained by the following formula, substituting for given stroke length, cycle numbers, and running distance:

$$L_h = (L/1.2 \cdot S \cdot n) \times 10^4 \quad \cdots\cdots (7)$$

In this formula:

L_h : Life hours (h)

L : Rated life (km)

S : Stroke (mm)

n : Cycles per minute (cpm)

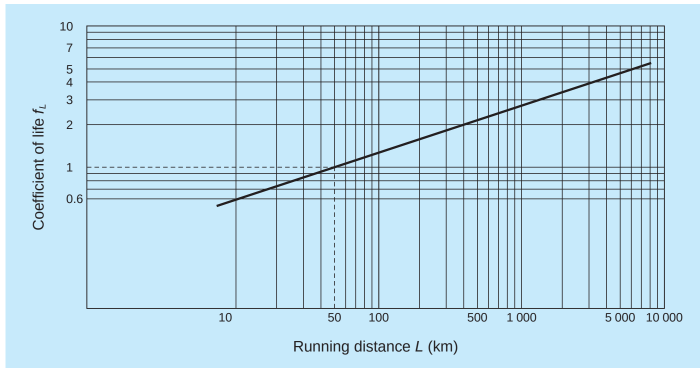

Fig. 5 Relationship between life factor and running distance

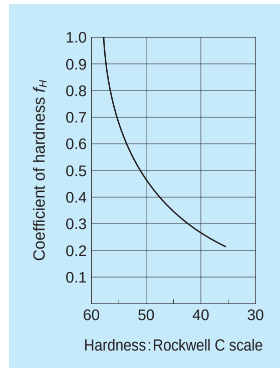

Fig. 6 Hardness factor

2. Basic static load rating

It is a load that the total permanent deformation of outer sleeve, ball and shaft, at the contact point, becomes 0.01% of the ball diameter when this load is applied to the rolling bushing. It is understood in general that this is the applicable load limit which causes this much permanent deformation, without hampering operation.

3. Calculation example

What is the appropriate rolling bushing size if required life is 5000 hours?

Conditions are:

- Three linear rolling bushings are installed in two parallel shafts, and support a reciprocating table.
- Load 450 N is equally distributed to the three bushings.
- The table is required to reciprocate on the shafts at 200 times per minute, at a stroke of 70 mm.
- Hardness of the shaft: HRC 55

$450/3 = 150$ (N)

- Load per linear rolling bushing is:

From Formula (7), the required life, when indicated in distance, is:

$$L = 5 \times 10^3 \times 1.2 \times 70 \times 200/10^4 = 8.4 \times 10^3 \text{ (km)}$$

From Fig. 5 and Fig. 6,
Life factor $f_L = 5.6$
Hardness factor $f_H = 0.65$
Therefore, from Formula (6),

$$C = P \times f_L / f_H$$
$$= 150 \times 5.6/0.65 = 1292 \text{ (N)}$$

Based on the above, select linear rolling bushing LB30NY with shaft diameter of 30 mm, basic dynamic load rating of 1400 N.

4. Compensating load rating by ball row position

Load rating of the linear rolling bushing changes by the position of the ball circuit rows.

Permissible load is larger when it is applied to the middle of the ball circuit rows than when it is applied directly above the ball row (Fig. 7).

(Radial clearance set at zero in this case.)

Load ratings in the dimension table are in case "A" when it is applied directly above the ball circuit row. If used as in case "B," the load rating becomes larger (Refer to Fig. 7).

	A Load is directly above the ball rows	B Load is applied at the middle between the ball rows	Increase rate of load rating ($\frac{B}{A}$) Dynamic load rating	 Static load rating
4 rows			1.15	1.41
5 rows			1.19	1.46
6 rows			1.06	1.28

Fig. 7 Increasing rate of load rating by position of ball row (B/A)

(9) Shaft Specification

Harden the shaft surface, where the balls run, with heat treatment to provide the following values.

- Surface hardness············HRC58 or over
- Depth of core hardness at HRC50 or higher
  - Depth for LB3 ; 0.3 mm or deeper
  - Depth for LB50 ; 1.2 mm or deeper

Roughness of the surface should be:

- For SP grade, and "the clearance for fit" with the ball bushing less than 5 µm -
  Less than 0.8 S
- For SP grade with "the clearance" of more than 5 µm, and for S grade -
  Less than 1.2 S

Bending should be:

- LB3 -- 15 µm/100 mm
- LB50 -- 100 µm/1000 mm

An appropriate clearance for normal use conditions can be obtained when the tolerance in shaft diameter remains within the recommended range (refer to Table 1 in Page A366). For operations which require particular accuracy, select the shaft diameter which creates a clearance in the range of 0 to 0.005 (mm) for example, when assembled with the rolling bushing.

(10) Dust Proof

Select a linear rolling bushing with seals to prevent moisture or foreign matters, which are floating in the air, from entering.

(11) Installation

1. Combination of shaft and linear rolling bushing

When the linear rolling bushing is installed in a linear motion table for its reciprocating movement, it is necessary to prevent the table from rotating.

In general, for this reason, two shafts, installed with two linear rolling bushings on each, are used.

Fig. 8 is an installation example.

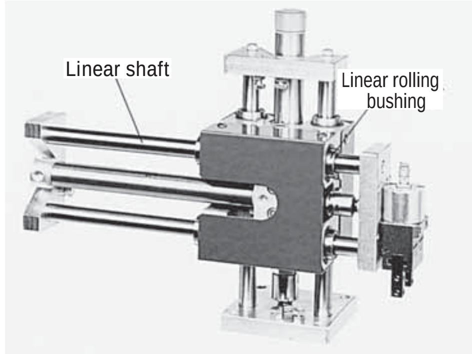

Fig. 8 Installation example

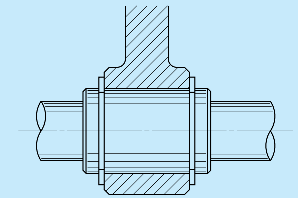
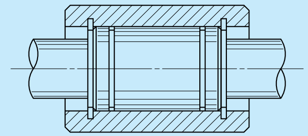
2. Installation of linear rolling bushing

① Standard type installation

Fig. 9 shows a method using a retainer ring. Linear rolling bushing can also be secured to the housing using a stop plate and/or screw.



Retaining ring method (1)



Retaining ring method (2)

Fig. 9 Installation using retaining rings

ⓐ Housing inside diameter should be of a recommended value (Table 2, Page A366). The entire rolling bushing contracts and gives excessive preload if: the inside diameter is small ; the roundness or cylindricity is excessive. This may result in an unexpected failure.

ⓑ To install linear rolling bushing, use a tool (Fig. 10) and squeeze it in, or use a holder and lightly pound it.

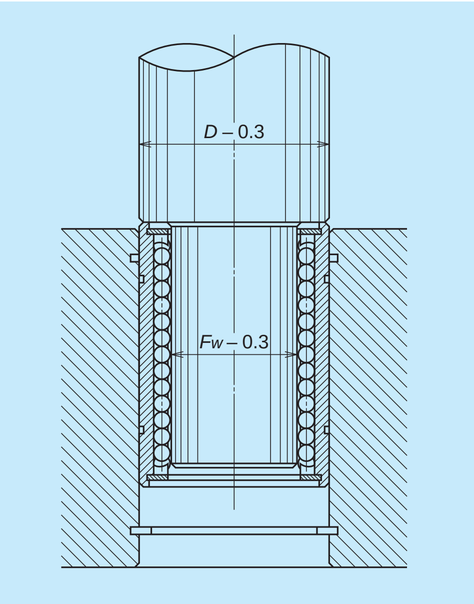


Fig. 10 Tool to install a linear rolling bushing

② Installation of adjustable clearance type

Use a housing which can adjust the inside diameter of the rolling bushing. This way, the clearance between the rolling bushing and the linear shaft can be easily adjusted. Arrange the cut-open section of the rolling bushing at a 90-degree angle to the housing's cut-open section. This is the most effective way to evenly distribute deformation toward circumferential direction.

The tolerance of shaft diameter of the adjustable clearance type should be within the recommended range (Refer to Table 1 in Page A366). As a general rule, set the preload at slight or light volume. (Do not provide excessive preload.) Use a dial gauge to measure and adjust clearance. However, here is an easy method to adjust .

First, loosen the housing until shaft turns freely. Then narrow the clearance gradually. Stop at the point when the shaft rotation becomes heavy. This creates a clearance zero or light preload.

③ Installation of open type

Use with clearance or with light preload.

Keep the tolerance in shaft diameter within the recommended range (Refer to Table 1 in Page A366), so the preload shall not become excessive.

(Unlike the adjustable clearance type, clearance cannot be narrowed by rotating the shaft because the state of shaft rotation does not indicate how narrow the space has become. Narrowing clearance requires caution for open type.)

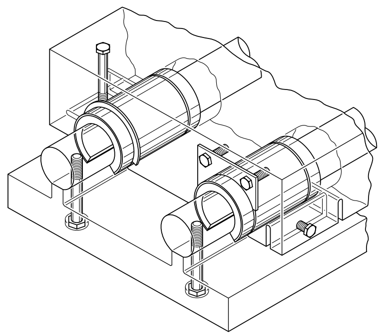

Fig. 11 Installation example of an open type

3. Precaution for installing a shaft in the linear rolling bushing

ⓐ To install two shafts parallel to each other, first install one shaft accurately. Use this as a reference, and install the other parallel to the first shaft. This makes installation easy.

ⓑ Do not incline the shaft when inserting it into the linear rolling bushing. Do not force it to enter by twisting. This deforms the retainer, and causes the balls to fall out.

ⓒ Do not use the shaft for rotating movement after the shaft is in the linear rolling bushing. The balls slip and damage the shaft.

ⓓ Do not twist the shaft after it is in the linear rolling bushing. The pressure scars the shaft.

A-6-2 Crossed Roller Guide

(1) Structure

Rollers with a retainer (hereinafter referred to as "retainer") are assembled in a pair of rails which have a V-shape groove. (the grooves form a 90-degree angle. Refer to Fig. 1, 2). Rollers are placed crisscrossed, and are able to support load in all directions, including moment loads.

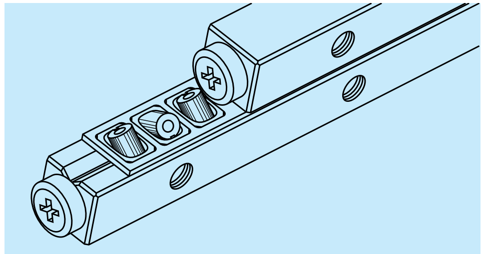

Fig. 1 Structure of crossed roller guide

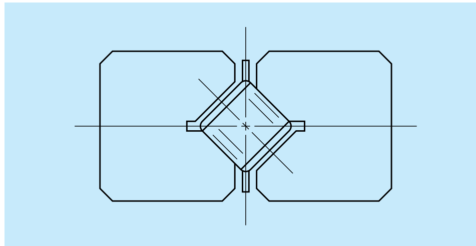

Fig. 2 Cross section of a crossed roller guide

(2) Features

1. High rigidity

This is attributable to the long contact area between the rollers and their accurately ground rolling surface.

2. Superbly smooth movement, low noise

The window which directly embraces the roller is made of plastic for smooth and quiet operation, lowering clatter when the retainer and the rollers come into contact.

3. Less micro-slip

Occasionally, a minute continuous slippage of the retainer to one direction, called "micro-slip," is caused due to installation error of the rail. After years of testing and research, NSK has developed technology to minimize this.

4. Easy installation

Installation is easy because the rail bending is minimal, and the bolt hole pitch for installation is precise.

5. Long durability

The material is vacuum-degassed and highly pure, and is hardened by carburized heat treatment for superb resistance to wear and fatigue.

(3) Accuracy

Accuracy grade P5 super precision and high precision grade P6 are available.
Fig. 3 shows parallelism of the roller's rolling surface to the mounting datum face.

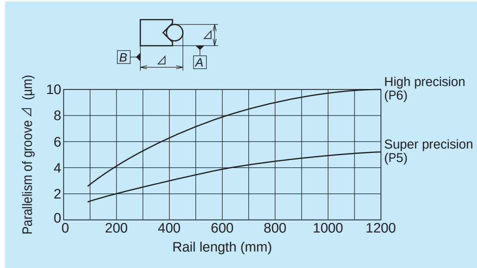

Fig. 3 Parallelism of the roller rolling surface

(4) Rigidity

The number of the load rollers changes by the direction of the load. This is because the rollers are positioned crisscross.
That is, in case of Fig. 4:

The number of load rollers =1/2 x total roller number ··································(1)

In case of Fig. 5:

The number of load rollers = Total roller number ··································(2)

Fig. 6 shows changes in elastic deformation when there are 20 load rollers. If the total number of rollers is other than 20, use the graph in Fig. 7. Obtain the compensation factor which converts the elastic deformation value at time of 20 load rollers into the value when a specific number of rollers are loaded. That is, obtain a compensation factor on the ordinate that correspond to the number of load rollers on the abscissa. Then, multiply this factor by the elastic deformation value (on ordinates) which corresponds to the load (on abscissa) shown in Fig. 6.

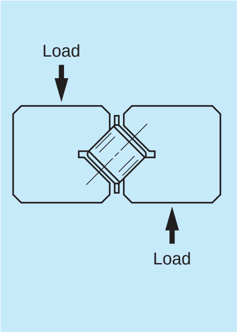

Fig. 4

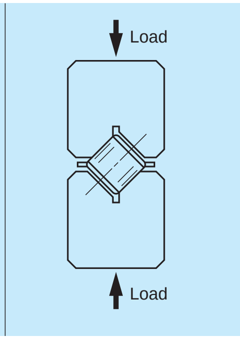

Fig. 5

[Calculation example: Elastic deformation]

A retainer which contains 30 rollers (roller diameter 6 mm) is installed on both right and left side (Fig. 8). How large is the elastic deformation of the crossed roller guide when a load of 4 kN is applied to the table center?

[Answer]

A load of 2 kN is applied to each side of the crossed roller guide. The elastic deformation value on the ordinate which corresponds to the load 2 kN on the abscissa (in Fig. 6) is:

4.5 µm

This application of load is the same as in Fig. 4. Therefore, the number of load rollers is one-half of 30, or 15. From Fig. 7, the compensation factor on the ordinate which corresponds to 15 rollers on abscissa is:

1.3

Multiply 1.3 by 4.5 µm obtained above. The answer is:

$4.5 \times 1.3 \fallingdotseq 6$ µm

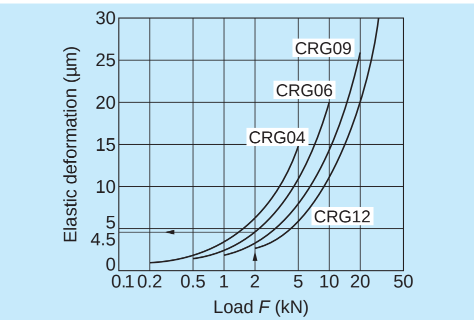

Fig. 6 Elastic deformation with 20 rollers

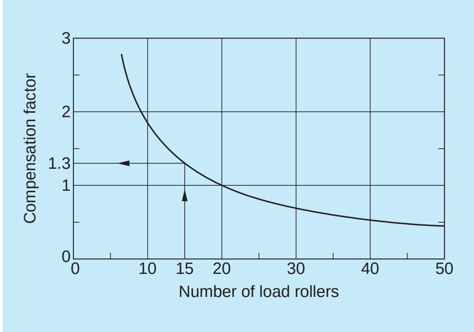

Fig. 7 Compensation factor to obtain elastic deformation

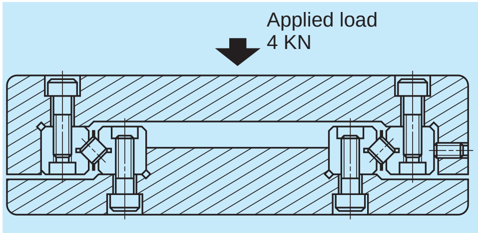

Fig. 8 Example calculation of elastic deformation (illustration)

(5) Friction Force

If installation and lubrication are appropriate, the starting friction coefficient is markedly small as shown below:

$\mu = 0.005$

(6) Lengths of Rail and Retainer

The relationship of rail length L with stroke S is as follows:

When $S \leq 400$ mm, $L \geq 1.5S$ ……………… (3)

When $S > 400$ mm, $L \geq S$ ……………… (4)

Since the retainer travels a distance of half of the stroke, the retainer length K is:

$K < L - \dfrac{S}{2}$ ………………………………… (5)

The retainer does not detach from the rail when condition in Formula (5) is satisfied (Refer to Fig. 9).

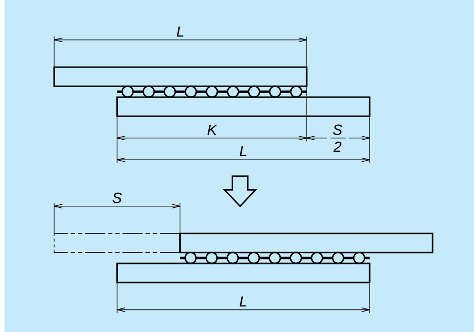

Fig. 9 Relationship of rail and retainer

(7) Lubrication and Dust Proof

For grease lubrication, lithium soap based greases of consistency 1 or 2 are used.

For example; NSK Grease LR 3,
NSK Grease PS 2,
NSK Grease AS 2

For oil lubrication, JIS viscosity 32 to 150 is recommended.

When necessary, install a bellows on the rail, or install a seal on the side of the rail to arrest foreign matters and dust as shown in Fig. 10.

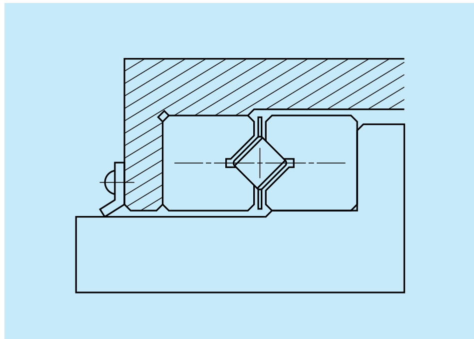

Fig. 10 Dust prevention (example)

(8) Installation

Fig. 11 shows the standard installation procedures.

ⓐ Secure Rail 1 and 2 to the bed using the fixing bolts. . Secure Rail 3 to the table with the bolts. Temporarily secure Rail 4 and loosen the side bolt.

ⓑ Match the Machine base and the table. Insert the retainer in the roller space. At this time, measure the distance from the rail end to the retainer end with a depth gauge to determine its position.
If the roller space is too narrow and the retainer does not go inside, slide Rail 4 toward the side bolt, then insert the retainer.

ⓒ Follow the reading of dial gauge which is previously set, and squeeze in all side bolts until they stop rattling. Do not apply excessive force.
When the side bolts are tightened, the rollers should be in the vicinity of the bolt position.
Then, secure Rail 4 with the fixing bolts.
Finally, install a stopper to the rail end.

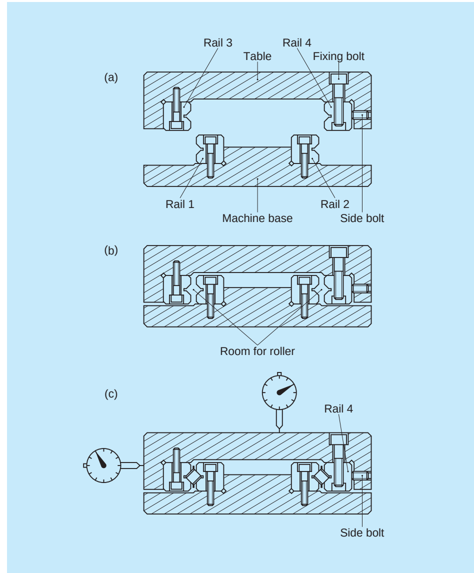

Fig. 11 Standard installation procedures

[Regarding preload]

As crossed roller guide has higher rigidity than other linear rolling guides, it does not need preload. It is also difficult to apply preload accurately. Crossed roller guide is usually used without clearance. For highly accurate applications, it is desirable to press the crossed roller guide by means of a bolt over the gib as shown in Fig. 12.

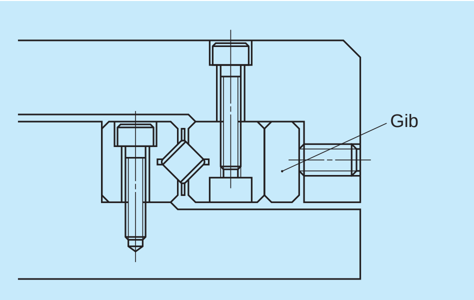

Fig. 12 Tightening using a gib

(9) Basic Static Load Rating

Basic static load rating becomes larger in proportion to the number of the load rollers "n." Obtain basic static load rating per roller C_{01}. Then the basic static load rating C_{0n} when the numbers of rollers is n can be obtained as follows.

$$C_{0n} = n \times C_{01} \quad \cdots\cdots (6)$$

Values of C_{01} are shown in the dimension table.

(10) Basic Dynamic Load Rating and Rated Life

Basic static load rating is based on a rated traveled distance of 50 km. The dimension table shows the value with 20 load rollers. When the number of load rollers is other than 20, a basic dynamic load rating C_n can be obtained by multiplying a compensation factor (obtained from Fig. 13.) by C in the dimension table.

(Suffix 'n' is to refer the number of load rollers.)

As an example; Number of load rollers: n = 15.

The compensation factor from Fig. 13 is 0.8.

$$C_{15} = 0.8 \times C$$

Therefore, C_{15} is obtained from the following formula.

Rated life (km) is shown in the formula below.

In this formula:

$$L = 50\left(\frac{C_n}{f_w \cdot F_c}\right)^{\frac{10}{3}} \quad \cdots\cdots (7)$$

f_w: Load factor. 1.0 to 1.2 under smooth operation

F_c: Computed load which applies to the guide (kN)

Please refer to NSK Linear Guide Technical Description for details.

(11) Reference Number and Standard Set for "One-Axis"

Specifications are indicated as a reference number as shown below.

CRG06-380 A P5 N

- CRG06 — Model number
- 380 — Rail length (mm)
- A — Shape of the rail cross section: Standard: A Semi-standard: T
- P5 — Accuracy grade: P5··· Super precision grade; P6··· High precision grade
- N — Holes for mounting: Tap hole: N; Drill hole: D

Note (1) : Semi-standard T, a shape of rail cross section, is available only for CRG04. It is lower in H dimension, and wider in W dimension compared with A.

Remarks : Standard set for "one axis" of the guide refers to 4 rails and 2 retainers which usually comprise the guide way for a one axis.

Remarks: The area which embraces the roller is plastic for the standard retainer. A solid type made of steel plate is available for high temperature resistance.

A-6-3 Roller Pack

(1) Structure

A roller pack comprises a main body which supports load from the guide way block via two rows of rollers; an end cap which changes the direction of the re-circulation of rollers at the end of the main body; a side plate which guides the rollers. (Fig. 1). Roller pack is one of the linear rolling guides, where rollers are allowed to re-circulate infinitely.

There is a plate spring attached to a side of roller pack to prevent roller pack from falling out when it is turned upside down after assembly.

Other component of the roller pack is spring pin. Spring pin is on the top surface of the roller pack, and makes installation of wedge block and fitting plate easier.

Wedge block is a unit to provide preload (Fig. 3) to roller pack; a fitting plate (Fig. 2), functioning like a pivot, adjusts misalignment of roller pack automatically. Wedge of wedge block moves up and down, to apply preload, by turning the adjust screw.

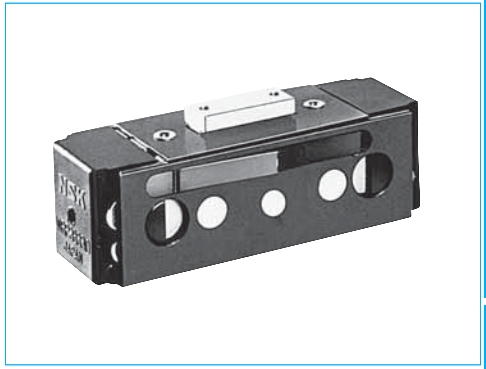

Photo 1 Roller pack

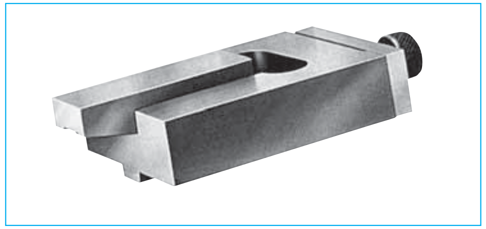

Photo 2 Wedge block

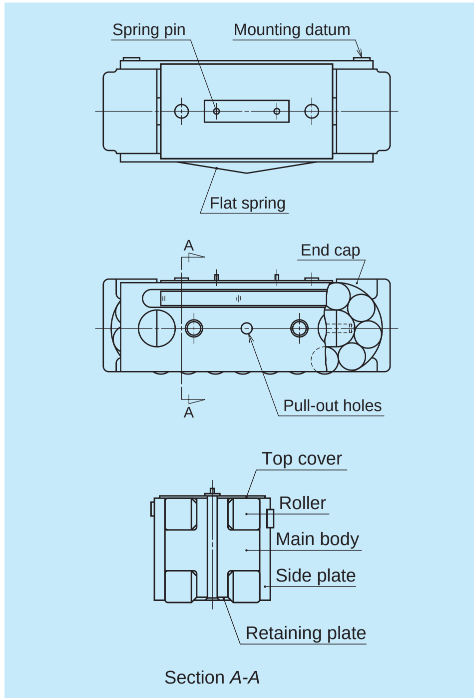

Fig. 1 Roller pack

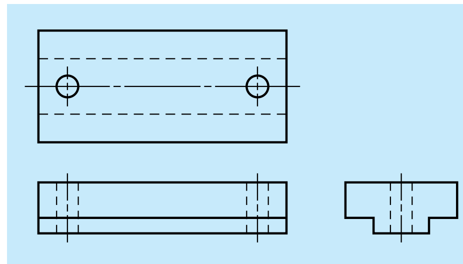

Fig. 2 Fitting plate

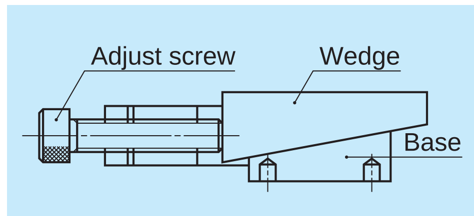

Fig. 3 Wedge block

(2) Features

Roller pack has two remarkable characteristics other linear roller guide bearings do not have.

① **No roller skewing**

If the roller is long relative to its diameter, the roller inclines during operation. This phenomenon is called skewing. Skewing causes problems such as sudden rise in friction force. However, a short roller lacks large load carrying capacity. The roller introduced here solved the skewing problem, yet has a large load carrying capacity:
short rollers are combined into double rows.

② **Load is applied equally.**

This is due to a "fitting plate," a result of "changed way of conceiving." Installation is quite easy: Merely place the fitting plate through the two holes to spring pins. The stop pins are inserted to holes on the top surface of the roller pack. The contact area between the fitting plate and the main body is made small. This way, the self-alignment is automatically accomplished by elastic contact of both parts.

This distributes an equal load to the rollers, far extending the life, compared to conventional roller linear guides.

Other characteristics include: Easy to provide preload by the wedge block; can be installed to vertical shaft; and reduction in noise level.

(3) Accuracy

The height tolerance of roller pack is 10 µm. Roller packs are grouped into a size difference of every 2 µm (corded by A to E) before delivery (Table 1).

Table 1 Height Classification

Unit: µm

Category	Code
over – or less	
+3 – +5	A
+1 – +3	B

(4) Rigidity

Fig. 4 shows the relationship between load and deformation. This includes deformation caused by contact between: the rollers and main body; the rollers and guide way surface; the main body and fitting plate.

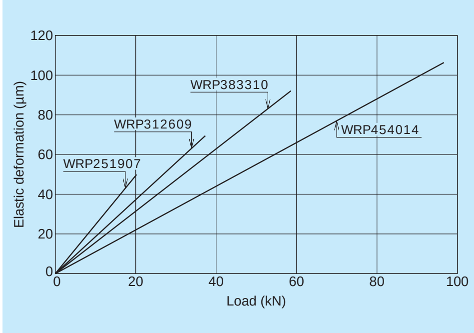

Fig. 4 Elastic deformation of the roller pack

(5) Preload

Fig. 5 shows conversions of tightening torque of the wedge block adjust screw into preload volume. Use a dial gauge for accurate measurement.

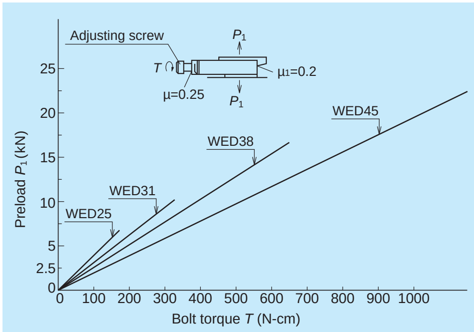

Fig. 5 Tightening torque of the adjust screw, and preload volume

(6) Friction and Lubrication

1. Lubricants and volume

Mineral oils are commonly used. Since roller pack is used under a relatively heavy load, the oil should, ideally, have high viscosity and provide a strong film. Select from JIS viscosity 32-150.

Criteria of oil supply per roller pack Q (cc/h) can be calculated by the following formula.

$$Q \geq S \times 1/4 \cdots\cdots (1)$$

In this formula, S (stroke) is shown in meters. The oil volume, when the stroke is 1 m, per roller pack is more than 0.25 (cc/h). It is more desirable to supply a small amount of oil at short intervals than supplying a large amount at one time. In case of grease lubrication, use a grease of consistency 2. Albania EP2 is widely used.

2. Friction coefficient

Starting friction coefficient is significantly small at under 0.005.

3. Seal

It is necessary to install a wiper seal to the guide way surface to prevent foreign matters (swarf from cutting, and other dust) from entering the roller pack to enjoy the full benefit of the designed life of it. The material of the seal should have strong resistance to oil and wear. Felt and synthetic rubber (acrylonitril butadiene rubber) are some of the suitable materials. Fig. 6 shows a general method to install the seals.

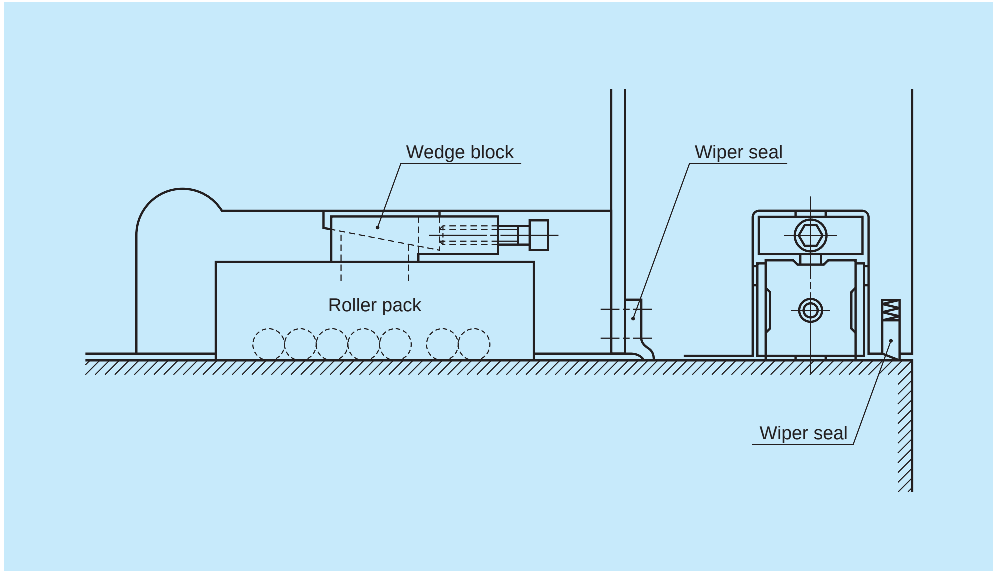

Fig. 6 Installation of seal

(7) Installation

1. Installation and applying preload

As shown in Fig. 7, it is basic that a fitting plate is installed on the roller pack which receives load, and a wedge block is installed on the roller pack which receives no load, but is only used for preload. All components should be secured with a stop pin, facing toward the direction of movement. To cut costs for processing, it is recommended to divide the pocket (which contains roller pack) into some blocks and secure them with bolts (Fig. 7). Preload is provided by the wedge block. Estimate the actual load beforehand, so the preload shall not be lost when a load is applied. A load variation equivalent to up to two times of the preload volume can be absorbed in this case.

(Take into consideration the life in (8) in determining preload volume.)

2. Accuracy of way block

The following is the ideal accuracy specification and installation accuracy of way block as a guide face.

Hardness by heat treatment
: More than HRC58 hardened depth 2 mm or more

Surface roughness
: Less than 1.6 S
Parallelism as a single unit: Less than 0.010 mm per meter

Parallelism after installation
: Less than 0.020 mm per meter

Please consult NSK when using cast iron or cast steel guide face.

3. Pocket accuracy

Accuracy of the pocket in which the roller pack is mounted should satisfy the following conditions.

Pocket width
: Roller pack width + 0.10 mm to 0.20 mm

Parallelism of the pocket side faces to the guide way face
: Less than 0.010 mm per 100 mm.

Parallelism of the fitting plate (pocket bottom) mounting face to the guide way face and parallelism of the wedge block mounting face to the guide way face :
: Less than 0.040 mm per 100 mm.

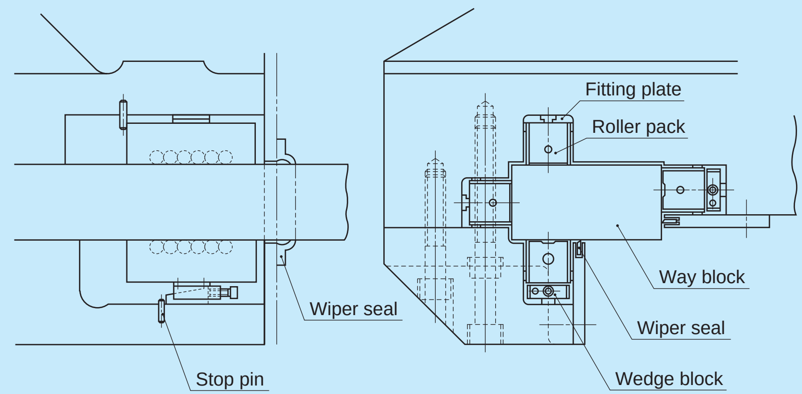

Fig. 7 Design of the roller pack pocket (example)

(8) Rated life

Rated life L (km) is shown in the following formula.
In this formula:

$$L = 50\left(\frac{C}{f_w \cdot F_c}\right)^{\frac{10}{3}} \quad \cdots\cdots (2)$$

C : Basic dynamic load rating (kN)

f_w : Load factors. 1.0 to 1.2 at time of smooth operation

F_c : Calculated load (kN) applied to the roller pack

(9) Disassembly

Remove the roller pack preloaded by the wedge block in the following manner.

- Loosen the adjust screw of the wedge block. Lightly tap the wedge. In case of light preload, the wedge loosens, and the roller pack can be pulled out.
- When pulling, put the bolt in the tap hole at the end of the end cap, and tug the bolt.
- In case of heavy load, the roller pack could not be pulled out by the above method. Hook a tool to the pull-out hole (Fig. 1) on the side plate of the roller pack, and pull out the roller pack.

A-6-4 Linear Roller Bearings

(1) Structure

Linear roller bearing comprises: A single row of rollers; the main body which supports load via rollers; the end cap which turns the roller re-circulating direction at the end of the main body from the loaded zone to the unloaded zone; a retaining wire which prevents rollers from falling out (Fig. 1).
The main body, as the cylindrical roller bearing, has a rib at both sides. The rib guides the rollers to travel correctly, and assists the rollers to circulate infinitely in the bearing in a stable manner. This contributes to the bearing's linear movement without the restriction of travel range.
NSK also developed a highly functional preload pad (Photo 2) to provide a slight preload to the bearing. The preload pad basically comprises parallel plates and sandwiched bellevile springs, having adjusted its spring rate.
Preloaded pad can be used in a machine tool in the following manner.
When two bearings are installed with one on the top and the other under the way block (the bearings comprise a set), a preloaded pad is used at the bottom bearing. This provides an equal preload to the top and bottom bearings. This way, to a certain extent, the variation in the load and the uneven thickness of the way block can be absorbed.

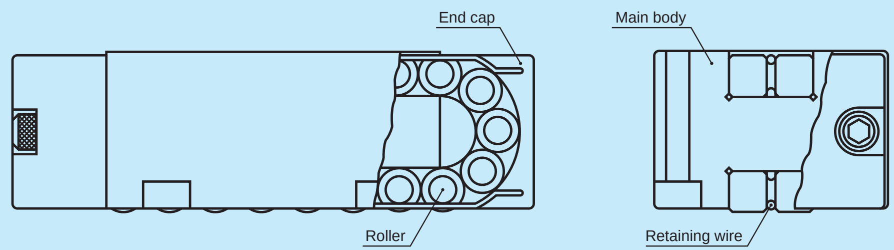

Fig. 1 Linear roller bearing

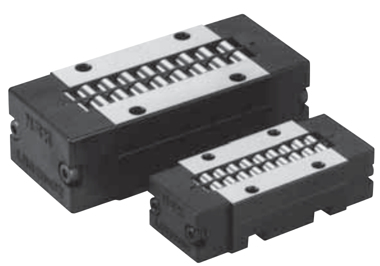

Photo 1 Linear roller bearing

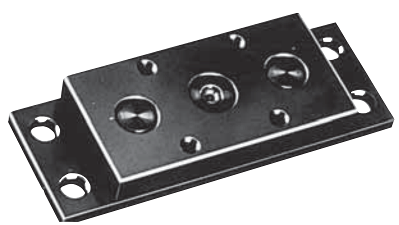

Photo 2 Preload pad

(2) Features

In addition to the general features of a roller bearing guide such as no-stick slip, small friction resistance, and easy maintenance, the linear roller bearing has several more advantages.

1. No trouble by roller skewing

Skewing is the inclination of the rollers during operation. It causes friction force to suddenly soar. Skewing is apt to occur when the roller is long relative to its diameter. The proportion of the length and diameter is 1:2 for the products in this series. This is superior to the commonly used 1:3 ratio.

2. Highly reliable

Retaining the rollers without allowing them to fall out of the bearing is a crucial function of the linear guide bearing. The simple and highly effective retaining wire has solved the problem for this product series.

3. Compact design

Despite the load carrying capacity, this series is smaller in size than any other models. This contributes to the application which requires compact design.

4. High rigidity

The contact area between the bearing and the mounting surface is large to increase rigidity.

(3) Accuracy

The nominal height difference between bearings is 10 μm. The bearings are grouped into every 2 μm, and are coded before delivery (Table 1).

Table 1 Classification of height

Unit: μm

–4	–	–6	C
–6	–	–8	D
–8	–	–10	E

(4) Rigidity

Fig. 2 shows elastic deformation.

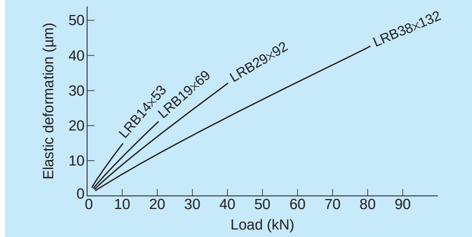

Fig. 2 Elastic deformation

(5) Friction and Lubrication

1. Lubricants and volume

Mineral oils are used in general. The linear roller bearing is used under relatively heavy load. An oil which has high viscosity and creates a strong oil film is ideal for linear roller guides. Select from JIS viscosity 32 to 150.
General oil supply for a linear roller bearing Q (cc/h) can be calculated by the following formula.

$$Q \geq S \times 1/4 \cdots\cdots (1)$$

In this formula, S (stroke) is shown in meters. Therefore, when the stroke is 1m, the volume of lubricant per roller bearing is more than 0.25 (cc/h). It is recommended to supply a small amount of oil at short intervals rather than supplying a large amount at one time. In case of grease lubrication, a grease of consistency degree 2, such as Albania EP2, is generally used.

2. Friction coefficient

Starting friction coefficient is significantly small at under 0.005.

3. Seal

Install a wiper seal on the way block surface to prevent foreign matters (cutting chip and other contaminant from entering) to realize a full life of the linear roller bearing. The material of the seal should have strong resistance against oil and wear. Felt and synthetic rubber (acrylonitril-butadien rubber) are some of the suitable materials.

(6) Installation

Secure the linear roller bearing using four bolts. The bearing main body has four holes for mounting.

Accuracy of way block

The ideal accuracy specification and mounting accuracy of a way block as a guide way surface are as follows.

Hardness by heat treatment
: More than HRC58 hardened depth 2 mm or more

Surface roughness
: Less than 1.6S

Parallelism as a single unit
: Less than 0.010 mm per 1 m

Parallelism after installation

Please consult NSK when using cast iron or cast steel guide way.

(7) Rated life

Rated life L (km) is shown in the following formula.

① Quick delivery

Standard ball screws are in stock for short lead time.

- Precision ball screws with finished shaft end
  PSS Type, MA Type, FA Type, SA Type, KA Type
- Precision ball screws with blank shaft end
  MS Type, FS Type, SS Type

Ball screws for transfer equipment are also available in stock.

- Finished shaft end

- Blank shaft end
  RMS Type, R Series

② Competitive prices

NSK reduces cost by well-planned mass production of standardized items. We rank the best in the world production of ordered items. We are able to offer our products at competitive prices by producing similar items in the same production group.

③ Unparalleled accuracy

NSK utilizes its unique grinding technique and measuring equipment for topnotch precision.

④ Superb durability

NSK uses thoroughly purified alloy steel for superb durability.

⑤ No backlash, and unparalleled rigidity

NSK ball screws use Gothic arch grooves as shown in Fig. 1.1. The Gothic arch has no clearance between the balls and grooves with applying preload, and no backlash can be obtained. As providing controlled rigidity is easy, appropriate rigidity is obtained.
As the Gothic arch also minimizes the clearance between the balls and the grooves, the backlash is minimized without applying preload.

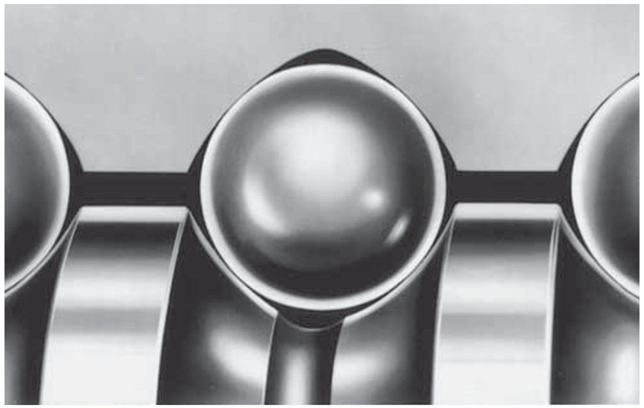

Fig. 1.1 Ball groove profile of NSK ball screw

⑥ Smooth movement assures high efficiency

NSK uses the Gothic arc design for the ball grooves. This design prevents the balls from slightly wedding into the groove of the ball nut and screw shaft and causing minute vibration. This phenomenon is common with the circular-arc design used by other manufacturers. The Gothic arc, along with the low friction inherent in a ball screw, results in a smooth and highly efficient conversion of motion as shown in Fig. 1.2.

⑦ Optimal units available

Utilizing bearing technology, NSK produces high quality support units (for light load type to be used for small equipment and heavy load type to be used for machine tools) which are exclusive for ball screws. These units are standardized and always in stock.
NSK also offers quality-assured accessories such as lock nuts to tighten bearings, travel stoppers to prevent overrun, and sealing units to cool hollow shaft ball screws.

B-1-2 Structure of a Ball Screw

Balls are placed between the screw shaft and nut, and roll. This system is called a "ball screw." To keep the balls recirculating continually, this system requires a screw shaft, a nut, balls, and recirculation components as basic items. A ball screw has the following functions.

① Converting motion: Changing rotary motion to linear motion (normal operation); Changing linear motion to rotary motion efficiently (back-drive operation).

② Increasing power: A small torque is converted to a large thrust force.

③ Positioning: Sets accurate position in linear motion.

B-1-2.1 Ball Recirculation System

A ball recirculation system is categorically most important, as well as the preload system, to classify the structure of ball screw.

As shown in Table 2.1, four types of ball recirculation system are used for NSK ball screw.

B-1-2.2 Preload system

There are four systems to apply preload to NSK ball screws depending on the application.

Table 2.2 Preload system for ball screw

Preload system	Double nut preload (D Preload)	Offset preload (Z Preload)	Oversize ball preload (P Preload)	Spring preloaded double nut (J Preload)
Structure				Description	Uses two nuts, and inserts a spacer between them to apply preload. In general, a spacer is thicker (by the deformation equivalent to the preload) than the actual space between two nuts. On the contrary, a thin spacer is inserted in some cases.	To apply preload, the lead near the center of the nut is enlarged by the volume equivalent to preload (α). Uses a single nut to create a preload similar to D preload. Not using spacer enables compact nut design.	Balls slightly larger than the space of the ball groove (over-size balls) are inserted to apply preload by balls' four-point contact. Provide better torque characteristics in the low torque range.	A spring is used as a spacer of D Preload. Must be used with discretion in its varied rigidity by load direction.

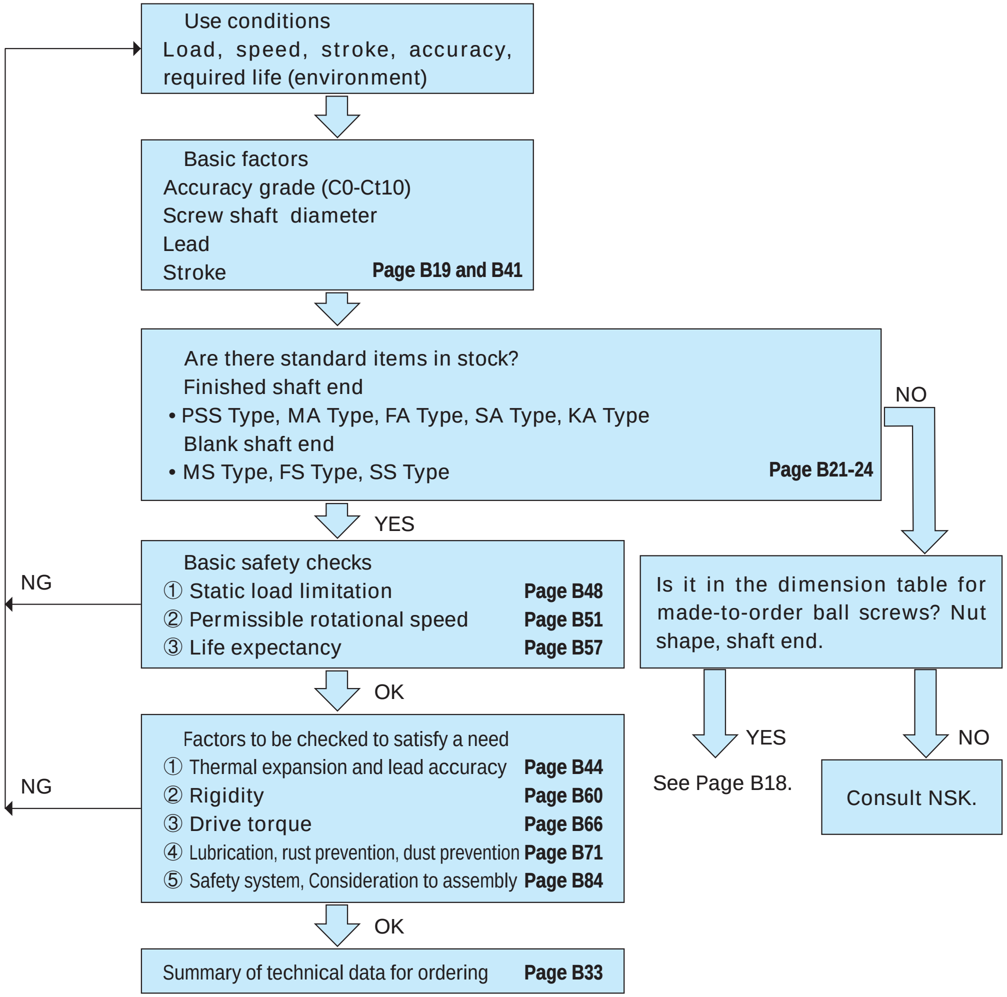
B-1-4 Procedures to Select Ball Screw

B-1-4.1 Flow Chart for Selection

When selecting a ball screw, you have to review a variety of use conditions and requirements such as applied loads, speeds, motion strokes, positioning accuracy, required life and operating environment.
You require a multiple inspection because some of these conditions force a ball screw to have conflicting characteristics.

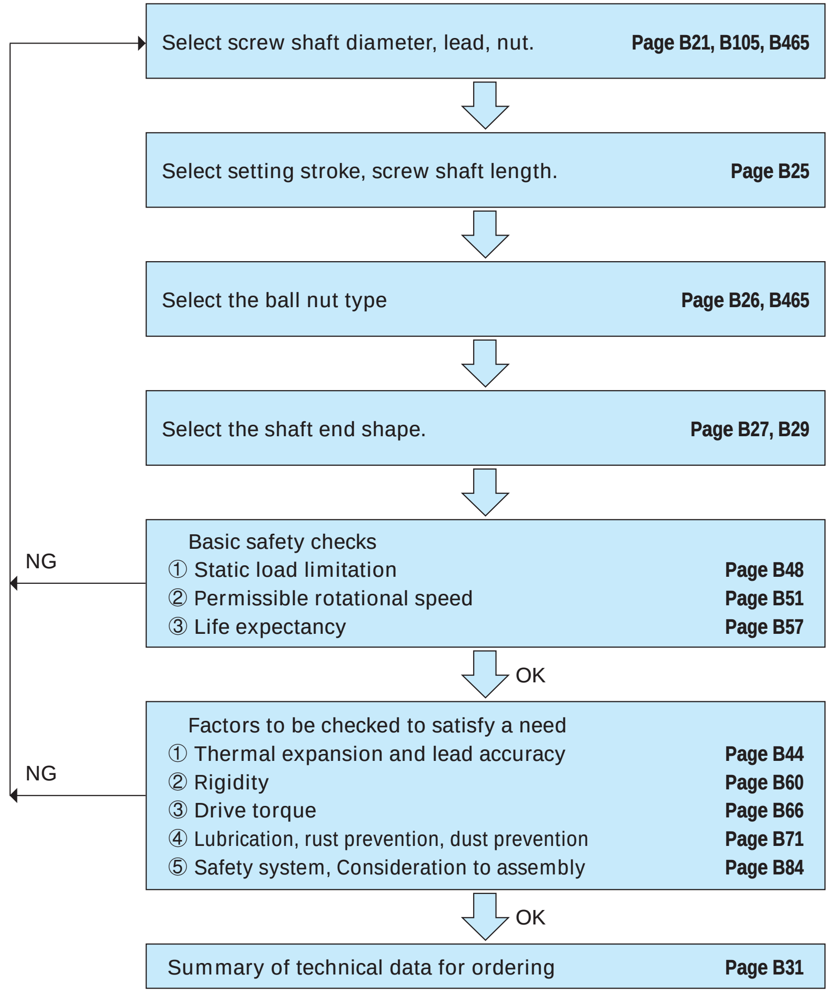
(1) Standard ball screw

The chart below is one of the selection methods. To take advantage of prompt delivery and reasonable prices, this method focuses on the standardized ball screws that are available in stock.
NSK offers a ball screw selection program, and also has a service to select appropriate items using data file compiled by our knowledge and experience.



(2) Made-to-order ball screws

Dimensions and specifications can be decided individually for the application-oriented ball screws and standard nut ball screws. Procedures are as follows. Refer to the selection exercises on Page B87.
Table 4.4 is "Combinations of screw shaft diameter and leads for basic type ball screw." Please consult NSK if you require the types that are not listed in the Table.



B-1-4.2 Accuracy Grades

Table 4.1 shows examples of how to select accuracy grade for a specific use. These practical cases are based on NSK's experience. Circle indicates the range of the accuracy grade in actual use. A double circle indicates accuracy grades most frequently used among cases marked with a single circle. These symbols help to select the accuracy grade of ball screws temporarily. To confirm whether a specific ball screw accuracy grade satisfies requirements in positioning accuracy in actual use, refer to "Technical Description" and "Mean travel deviation and travel variation." (Page B42)

B-1-4.3 Axial Play

Table 4.2 indicates combinations of NSK ball screw accuracy grades and axial play. Select an axial play which satisfies the required accuracy in backlash, positioning and repeatability. Ranges of available ball thread effective length in relation to accuracy grade and axial play are shown in Table 4.3. Please note that if the effective length exceeds the range, the axial play may become partially negative (preloaded condition).

For axial play of Ct10 grade (ball screws for transfer equipment), refer to the R series dimension tables.

80 – 125	—	—	4000	3000	3000

Remarks: Refer to Table 4.8 (Page B25) for the available length of screw shaft (maximum length). Also, axial play of code N does not become partial negative play if it is within the available range of effective ball thread length.

B-1-4.4 Screw Shaft Diameter, Lead, and Stroke

Choose a screw shaft diameter and stroke based on the allowable space for ball screw installation. Lead should be set based on the required running speed, and should give some allowance to the maximum rotational speed of the motor.

(1) Made-to-order ball screws

Table 4.4 shows the combinations of screw shaft diameter and leads for made-to-order ball screws. For details, refer to the dimension tables from Page B105 and B465.

B-1-4.5 Manufacturing Capability for Screw Shaft

Table 4.8 shows the manufacturing capability for the screw shaft overall length for each accuracy grade. The capability of large ball screw whose shaft diameter exceeds 100 mm is limited due to the weight. Please consult NSK in such a case. (∗)
Also consult NSK if the screw shaft size you desire exceeds the size listed in Table 4.8.

Remarks: 1. Values in parentheses of Ct10 are applicable to the ultra high helix lead (l/d≥2). Refer to dimension tables in B203 and following pages for details.
2. Please note that the range for small leads (3 mm or under) are also limited by the screw length.

B-1-4.6 Outside Shapes of Ball Nut

(1) Flange shape

Fig. 4.1 shows the available flange shape. Select the appropriate shape according to the nut installation condition. (Fig. 4.2)

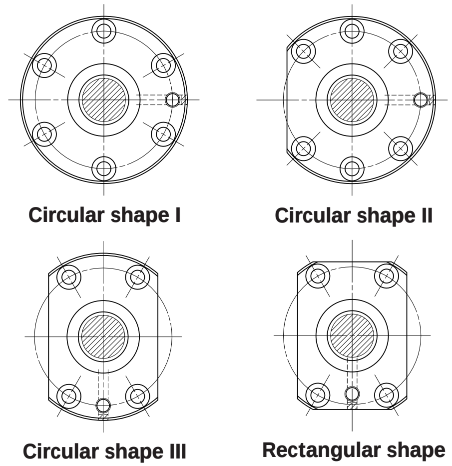

Fig. 4.1 Flange shape

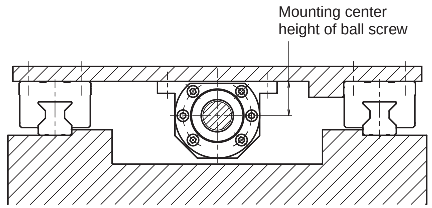

Fig. 4.2 Installation example

(2) Shapes of nut cross section

Cross-section of nuts are shown in Fig. 4.3. For detailed dimensions, refer to "Dimension table of nut."

① **Circular (round)**
The ball recirculation components are contained inside the circumference of the nut. It can be inserted in a round hole.

② **Tube-projecting type**
This shape is unique to the tube recirculation type. The nut outside diameter is small. However some recess must be given for housing because the ball recirculation tube protrudes from the circumference of the nut.

B-1-4.7 Shaft End Configuration

(1) Standard shaft end dimensions

Table 4.9 and 4.10 show shaft end types for NSK standard support units.

B-1-5 When Placing Orders

To avoid confusion, please use "reference number" or "specification number" when inquiring about desired ball screw specifications.

◇ **Reference number**:

Alpha-numeric codes are assigned to each ball screw. When placing order, please use this reference number.

◇ **Specification number**:

Specification factors are identified by alpha-numeric codes. Codes are for easy explanation of your requirements. (If you do not use these numbers, please itemize your requirements.)

B-1-5.1 When Ordering Made-to-Order Ball Screws

If you would like to discuss technical points regarding specifications, use the NSK ball screw technical data sheet as an aid (Page B36). For high-load drive ball screws, use the technical sheet for NSK high-load drive ball screw.

(1) Specification number of made-to-order ball screw

DFT 5010-5 L C3 Z-850/1230

- Nut model
- Screw shaft diameter (mm)
- Lead (mm)
- Effective turns of balls (number of turns of balls x number of circuit)
- Direction of turn : No code, Right; L, Left
- Screw shaft length (mm)
- Threaded length (mm)
- Axial play
- Accuracy grade

(2) Reference number of made-to-order ball screw

W 50 12 - 26 L D - C1 Z 10

- Product code (Ball Screw)
- Screw shaft diameter (mm)
- Effective threaded length (by the unit of 100 mm)
- Design serial number
- Direction of turn : No code, Right; L, Left
- Lead (mm)
- Axial play
- Accuracy grade
- Ball screw specification/appearance

(3) Reference number of ball screws for transfer equipment with finished shaft end and blank shaft end

VFA 15 10 C7 S - 500

- Ball screws for transfer equipment: VFA, RMA, RMS
- Screw shaft diameter (mm)
- Lead (mm)
- Screw shaft length (mm)
- Axial play
- Accuracy grade

(4) Reference number of R series ball screws for transfer equipment

Nut assembly

R NFTL 25 10 A 5 S

- Product code (nut assembly)
- Nut model: RNFTL, RNFBL, RNSTL RNCT, RNFCL
- Screw shaft diameter (mm)
- Seal code S: With seal No code: Without seal
- Effective turns of balls(number of turns of balls × number of circuit)
- Internal design specification code
- Lead (mm)

Screw shaft

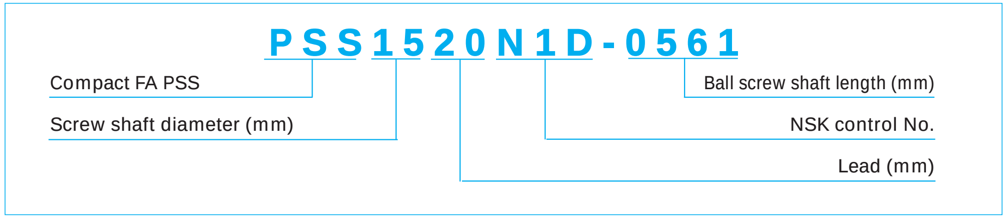
RS 25 10 A 20

- Product code (screw shaft)
- Screw shaft diameter (mm)
- Screw shaft length (× 100)
- Internal design specification code
- Lead (mm)

B-1-5.2 When Ordering Standard Ball Screw

Find the reference number from the dimension table. Enter the reference number in the "Order Form by Fax" (Page B34). Send the fax to a NSK agency (branch office, sales office, or your local representative.).

(1) Example of reference number of Compact FA PSS Type



(2) Example of reference number of Standard ball screw

Endurance of the ball screw

(1) Mounting accuracy, load conditions, and lubricating conditions are the main factors affecting the ball screw fatigue life. Therefore, we recommend evaluating the influence of those factors on actual use of your machines.
(2) A temperature rise caused by operational and environmental conditions may reduce the effectiveness of lubricant.

B-2 Technical Description of Ball Screws

B-2-1 Accuracy

B-2-1.1 Lead Accuracy

The lead accuracy of NSK precision ball screws (C0-C5 grades) conforms to the four characteristics specified in JIS Standards. These characteristics are expressed by codes *ep*, υ_u, υ_{300}, and $\upsilon_{2\pi}$.
Fig. 1.1 explains the definition of each characteristic, and shows allowable value of each. Leads are classified into two categories: C system for positioning; Ct system for transportation. Table 1.2, 1.3 and 1.4 show tolerance of each characteristic.
JIS B1192 sets C type and Cp type standards for positioning ball screws. NSK uses the specification of C type only. JIS B1192 specifies Ct1, 3, and 5 grade. NSK standards are integrated by C type only. Refer to Table 1.2 for C type standard tolerance.

Table 1.1 Terminology in lead accuracy

Term	Code	Description	Tolerance
Specified travel	*ls*	The travel compensates the nominal travel for an elongation caused by an increase of temperature or load.	
Travel compensation	*T*	Value obtained by subtracting the specified travel from the nominal travel based on the useful travel. The value is to compensate for the errors caused by thermal deformation or deformation by load.This value is determined by tests and experience (See Page B43).	
Actual travel	*la*	Actually measured travel	
Actual mean travel	*lm*	A straight line that demonstrates the direction of actual travel. This straight line is obtained from the curve that shows actual travel volume by least-squares method or by resembling approximation.	
Tolerance on specified travel	*ep*	Obtained by subtracting the specified travel from the actual mean travel.	Table 1.2
Travel variation	υ_u υ_{300} $\upsilon_{2\pi}$	Maximum range of the actual travel which is between the two straight lines drawn parallel to the actual mean travel. There are three categories as shown below. • Maximum range relative to the effective length of thread. • Maximum range relative to the length of 300 mm anywhere within the effective length of thread. • Maximum range which corresponds to any single rotation (2π*rad*.) within the effective length of thread. Example of specifying lead accuracy

<Use Conditions>

Nut model: DFT4010-5

Stroke: 1000 mm

Positioning accuracy: ±0.035 mm/1000 mm

<Calculation>

Obtain required lead accuracy of a ball screw under these conditions.

①Calculate the length of the thread

Stroke + nut length + margin =1000 + 193 + 100

=1293 (mm)···→1300 mm

②Calculate lead accuracy

From Table 1.2, obtain the tolerance on specified travel relative to the length of thread (1300 mm).

C5 ··· ±0.054/1250 – 1600

C3 ··· ±0.029/1250 – 1600

③Determine lead accuracy

Positioning accuracy is: ±ep ＜±0.035/1000 mm

> Accuracy grade: C3 grade ±*ep* = 0.029/length of thread (1300 mm)
> υ_u = 0.018

B-2-1.2 Thermal Expansion and Target Value of Specified Travel

(1) Thermal expansion

Thermal expansion of screw shaft induces the degradation of positioning accuracy of the ball screws. Thermal expansion of a screw shaft is calculated as follows.

$\Delta L_\theta = \rho \cdot \theta \cdot L$(mm) -- (Ⅱ-1)

In this formula:

- ΔL_θ : Thermal expansion (mm)
- ρ : Thermal expansion coefficient (12.0×10^{-6} °C^{-1})
- θ : Average temperature rise of screw shaft (Celsius)
- L : Length of screw shaft (mm)

The above formula indicates that when the temperature rises one degree Celsius, the screw shaft stretches 12 µm per meter. Ball screw generates more heat when it is used at high speed. This causes elongation of the screw shaft. Although the ball screw lead is ground into high precision, an elongated screw shaft due to high temperature rise may not satisfy required highly accurate positioning.

(2) Countermeasures against temperature rise

Countermeasures against temperature rise of the ball screw are:

Hollow shaft cooling is recommended to operate high-speed and high-precision conditions.

① Suppress heat generation

- Do not apply excessive preload to the ball screw and support bearing.
- Select correct lubricant and use it appropriately.
- Use higher helix ball screw lead to lower rotational speed.

② Use forced cooling.

- Use hollow screw shaft, and flow liquid coolant through it. - Refer to hollow ball screws in the section for application-oriented ball screws (Page B144).
- Cool screw shaft surface with lubricant oil or air.

③ Avoid effects of temperature rise on positioning

- Warm up the machine by high speed until temperature rise saturate, then maintain a stable temperature of ball screw shaft.
- Set pre-tension. (Fig. 1.2)
- Set the negative (minus) target value of specified travel.
- Employ the closed loop control system.

(3) How to determine specified travel

In general, the specified travel of ball screw is the same as the nominal travel . However, the specified lead of ball screw is sometimes set to negative (minus) or positive (plus) to adjust expansion by temperature rise during operation, or the elongation/contraction of the screw shaft by external load. For such occasion, specify travel compensation (T) when ordering the ball screw.

As an example, Table 1.5 shows the travel compensation (T) for typical NC machine tools.

Table 1.5 Travel compensation (T) of specified travel for typical NC machine tools

Unit: mm

Type of machine	Axis	Travel compensation (per 1 m)
NC lathe	X	– 0.02 — – 0.05
	Z	– 0.02 — – 0.03
Machining center	X, Y	– 0.03 — – 0.04
	Z	Differs by structure

(4) How to determine pre-tension force

In order to absorb thermal expansion, pre-tension can be provided to the screw shaft at the time of installation. In this case, the pre-tension is usually equivalent to the expansion brought about by the temperature rise of 2 to 3°C.

Fig. 1.2 shows the bearing support structure in such occasion.

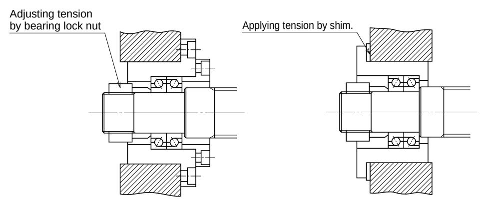

Fig. 1.2 Bearing structure to provide pre-tension

B-2-1.3 Mounting Accuracy and Tolerance of Ball Screws

The accuracy related to mount the ball screws is specified in the following seven characteristics (Fig. 1.3).

The tolerance is indicated in the specification drawing.

Detailed tolerances are specified by JIS B1192. For reference, Table 1.6 shows standard values of "(7) Total run-out of the screw shaft axis (straightness of the screw shaft)". NSK sets stricter tolerance standards than JIS standards. For accuracy of the ball screw installation, refer to "Installation of Ball Screw (1) Centering of the units" (Page B77).

(1) Radial run-out of the support bearing seat relative to the axis of the ball thread of screw shaft.
(2) Radial run-out of the other shaft ends section relative to the axis of the support bearing seat.
(3) Perpendicularity of the shoulder of support bearing seat relative to the axis of support bearing seat.
(4) Perpendicularity of the nut flange face, or of the nut end datum face, relative to the axis of screw shaft.
(5) Eccentricity of the nut outside surface (cylindrical shape) to the axis of screw shaft.
(6) Parallelism of the nut mounting surface to the screw shaft axis. (in case of flat mounting surface)
(7) Total run-out of the screw shaft axis.

B-2-1.4 Automatic lead accuracy measuring system of NSK

In response to the demand for high precision in production technology, NSK is the first in the world that developed and uses "Lead Accuracy Measuring System (LAMS)." Lead accuracy is measured by the system that employs a laser interferometer measuring instrument and a personal computer.

Fig. 1.4 shows the lead accuracy measuring system. The inspection date of the ball screw is shown in Fig. 1.5. The laser interferometer measures either ball nut travel accuracy or lead accuracy of the ball thread. The data which are input into a computer are processed into four characteristics readings regarding lead accuracy. (See Page B41.)

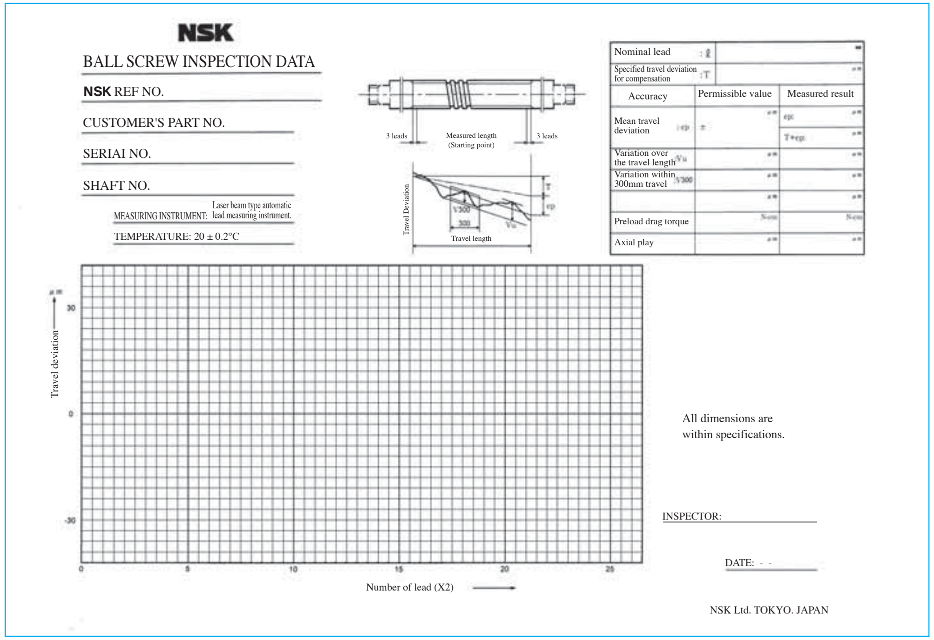

Fig. 1.5 Ball screw Inspection data

B-2-2 Static Load Limitation

Ball screw, based on its function, will generally receive axial load only. Ball screw shaft in general is long, so it is necessary to consider 3 items below:

- Buckling load of the screw shaft
- Yielding of the screw shaft by tensional or compressive stress
- Permanent deformation at the ball contact points

B-2-2.1 Buckling Load

It is necessary to calculate whether the ball screw shaft is safe against buckling.

Buckling load, i.e. permissible compressive load "P" to axial direction, is calculated as follows.

$$P = \alpha = \frac{N \bullet \pi^2 \bullet E \bullet I}{L^2} = m\,\frac{d_r^{\,4}}{L^2} \times 10^4 \quad \text{(N)} \cdots\cdots (\text{Ⅱ-2})$$

In this formula:

α : Safety factor (α = 0.5)

E : Elastic modulus (E = 2.06 x 10^5 MPa)

I : Moment of inertia

$$I = \frac{\pi}{64} d_r^{\,4} \quad (\text{mm}^4) \cdots\cdots (\text{Ⅱ-3})$$

d_r : Screw shaft root diameter (mm) [See the dimension table.]

L : Unsupported length (mm) [See Fig. 4.1 and 4.2 'Supporting conditions of screw shaft and nut' in Page B55.)

m, N : Factors determined by the supporting condition of the ball screw shaft

Table 2.1 Factors of bucking load

Supporting condition	*m*	*N*
Fixed - Fixed support	19.9	4
Fixed - Simple support	10.0	2
Fixed support - Free	1.2	0.25
Simple - Simple support	5.0	1

<<Calculation example of buckling load>>

Calculate buckling load under the conditions in Fig. 2.2.

<Use conditions>

Nut model: DFT4010-5

Supporting condition is Fixed - Fixed support (From the supporting condition (ii) in Fig. 4.1 'Supporting conditions of screw shaft and nut' in Page B55.)

Unsupported length L = 2000 mm

Screw shaft root diameter d_r = 34.4 mm (From the dimension table)

<Calculation>

Support condition is Fixed - Fixed support, From Table 2.1 in Page B48

N = 4

m =19.9

By Formula (Ⅱ-2) in Page B48

$$P = m\frac{d_r^{4}}{L^{2}} \cdot 10^{4} = 19.9 \times \frac{34.4^{4}}{2000^{2}} \times 10^{4} = 69667 \text{ (N)}$$

Therefore,

Permissible buckling load P = 69600 N

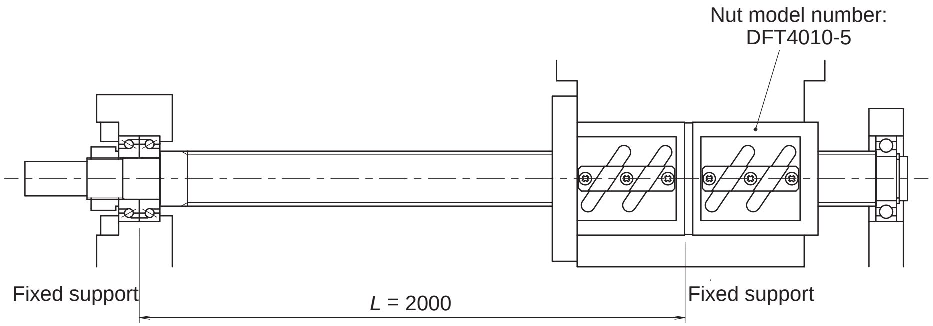

Fig. 2.2 Calculation example of buckling load

B-2-2.2 Yield by Tensional/Compressive stress

It is necessary to consider permissible load in regards to the yield stress.

Permissible load "P" by tensional or compressive stress to screw shaft is

$$P = \sigma \cdot A = 1.15 d_r^{2} \times 10^{2} \text{ (N)} \qquad (\text{Ⅱ-4})$$

In this formula:

σ : Allowable stress (= 147 MPa)

A : Cross section area of a screw shaft using root diameter (mm^2)

$$A = \frac{\pi}{4} \cdot d_r^{2} \text{ (mm}^2\text{)} \qquad (\text{Ⅱ-5})$$

d_r : Screw shaft root diameter (mm)

<<Calculation example of yield load>>

Obtain load in respect to the allowable stress under the conditions in Fig. 2.2.

<Use conditions>

Nut model: DFT4010-5

Screw shaft root diameter d_r = 34.4 (mm)

(From the dimension table)

<Calculation>

By Formula Ⅱ-4

$P = 1.15 d_r^{2} \times 10^{2} = 1.15 \times 34.4^{2} \times 10^{2}$

= 136086 (N)

Therefore,

Permissible load P = 136000 N

B-2-2.3 Permanent Deformation of the Ball Contact Point

Exposed to an excessively heavy load in axial direction, the balls are squashed, and the ball rolling surface is dented. The deformations on these points do not perfectly restore to original shape after the load is removed. They are permanently disfigured. It is necessary to determine the limitation of this disfigurement to containing it within a certain range.

(1) Basic static load rating C_{0a}

Basic static load rating C_{0a} is a load to axial direction that results in the combined permanent deformation equal to 0.01% of the ball diameter at the contact points of ball and ball grooves of the screw shaft and nut.

(2) Calculation of permissible load by C_{0a}

P_o (allowable axial direction load to limit the permanent deformation) is calculated using C_{0a}.

$$P_0 = \frac{C_{0a}}{f_s} \text{ (N)} \qquad (\text{Ⅱ-6})$$

In this formula, f_s: Static permissible load factor

Table 2.2 Static permissible load factor

At time of normal operation	1 – 2
With vibration impact	1.5 – 3

<<Calculation example of maximum allowable load>>

Obtain maximum allowable load to the ball groove section under conditions in Fig. 2.2

<Use conditions>

Nut model: DFT4010-5

Basic static load rating C_{0a} = 137000 (N)

(From the dimension table)

Static permissible load factor f_s = 2

(normal operation, no vibration impact)

<Calculation>

By Formula Ⅱ-6, maximum allowable load of the ball groove section

$$P_0 = \frac{C_{0a}}{f_s} = \frac{137000}{2} = 68500 \text{ (N)}$$

B-2-3 Permissible Rotational Speed

Permissible rotational speed is determined by the feeding speed and ball screw lead. When selecting ball screw, it is important to know the permissible rotational speed.
It is necessary to calculate two items below, and whichever smaller is the permissible rotational speed.
The lower of the following two factors, d·n and Critical Speed, will determine the overall Permissible Rotational Speed of the ball screw.

- Critical speed which is the resonance vibration of the shaft.
- d·n value which is involved in damaging the ball recirculation components.

* Please consult NSK if the maximum rotational speed exceeds the criteria of maximum rotational speed on page B54, even both the critical speed of screw shaft rotation and the d·n value are in range of the allowable limit.

B-2-3.1 Critical Speed of the Screw Shaft

Calculate the critical speed which is the matching value of the ball screw rotational speed and the natural frequency of the screw shaft. The permissible rotational speed is up to the 80% range of the critical speed.
Calculate the critical speed of the screw shaft whether you use shaft rotation or nut rotation. Critical speed varies by the nut traveling position. Please consult NSK for detailed calculation.
If using a ball screw exceeding the critical speed, it is necessary to increase the natural frequency by using an intermediate support, etc. If using with nut rotation, it is possible to operate exceeding critical speed by installing a vibration energy absorbing system (optional, vibration control damper: patented by NSK) to the screw shaft. (Refer to "Nut rotatable drive ND Series" in Page B149.)

Calculate the permissible rotational speed based on critical speed n_c as follows, taking in account "supporting conditions for calculation of buckling load and critical speed" on Page B55.
Fig. 3.1 shows the permissible rotational speeds against critical speed for each shaft diameter.

$$n_c = \alpha \times \frac{60\lambda^2}{2\pi L^2}\sqrt{\frac{E \cdot I \cdot g}{\gamma \cdot A}}$$

$$= f\,\frac{d_r}{L^2} \times 10^7\ (\mathrm{min}^{-1}) \qquad (Ⅱ\text{-}7)$$

In this formula:

α : Safety factor (α = 0.8)
E : Elastic modulus (E = 2.06 × 10^5 MPa)
I : Moment of inertia of area of screw shaft

$$I = \frac{\pi}{64} d_r^4\ (\mathrm{mm}^4) \qquad (Ⅱ\text{-}3)$$

d_r : Screw shaft root diameter (mm) [See the dimension table.]
g : Acceleration of gravity (= 9.8 × 10^3 mm/s^2)
γ : Specific weight (γ = 7.65 × 10^{-5} N/mm^3)
A : Cross section area of the screw shaft root diameter (mm^2)

$$A = \frac{\pi}{4} d_r^2\ (\mathrm{mm}^2) \qquad (Ⅱ\text{-}5)$$

L : Unsupported length (mm) [See Fig. 4.1, 4.2 'Supporting conditions of screw shaft and ball nut' on Page B55]
f, λ : Factors determined by the supporting condition

Table 3.1 Coefficients of critical speed

Supporting condition	f	λ

Unsupported length L = 2000 mm

Screw shaft root diameter d_r = 34.4 mm (From the dimension table)

<Calculation>

Supporting condition is Fixed-Simple support, from Table 3.1 in Page B51

$\lambda = 3.927$

$f = 15.1$

By Formula Ⅱ-7 in Page B51, permissible rotational speed to critical speed is

$$n_c = f\frac{d_r}{L^2}\times 10^7 = 15.1\times\frac{34.4}{2000^2}\times 10^7 = 1298.6\ (\mathrm{min}^{-1})$$

n_c = 1290 min^{-1} or under

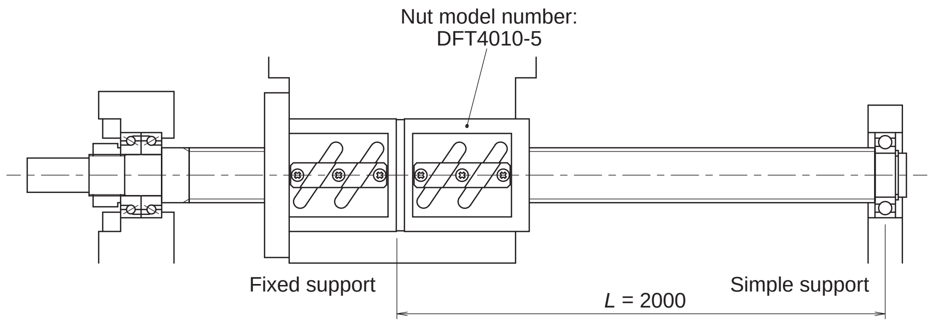

Fig. 3.2 Calculation example of permissible rotational speed to the critical speed

B-2-3.2 d·n value

An increase of ball orbital speed will increase the collision impact of balls to ball recirculation parts, and thus resulting in damage to them. For this reason, Permissible rotational speed is also limited by the d·n value (d: shaft diameter in millimeters; n: rotational speed per minutes). Table 3.2 shows the allowable d·n value and maximum rotational speed of ball screws.

∗Special measure must be taken for high-speed specification products. Please consult NSK.

∗Please consult NSK if the maximum rotational speed or the d·n value exceed the values on the table below, even both the critical speed of screw shaft and the d·n value are in ranges of the allowable limit.

B-2-4 Supporting Conditions for Calculation of Buckling Load and Critical Speed

Fig. 4.1 and 4.2 are typical conditions in supporting ball screw. Use them as reference to calculate buckling load and critical speed.
Please consult NSK if it is necessary to scrutinize calculation due to use conditions, or if boundary conditions are not clear due to special installation.

[How to read the tables]
Example ii: Buckling load generates between the nut and the left bearings, indicating that the critical speed appears between the nut and the right bearing. Therefore, set L at maximum stroke for each side. Calculate by applying support bearing conditions.

B-2-5 Life (dynamic load limitation)

B-2-5.1 Life of Ball Screw

Although used in appropriate conditions and is ideally designed, the ball screw deteriorates after a certain operation period, and eventually becomes unusable. The period in this situation is the life of the ball screw. There are two life categories, "fatigue life" caused by flaking, and "life of accuracy" caused by deterioration in precision because of wear.

B-2-5.2 Fatigue Life

Fatigue life of the ball screw can be estimated by basic dynamic load rating (C_a) as is for the rolling bearing.

(1) Basic dynamic load rating C_a

Basic dynamic load rating is the axial load which allows a 90% of the group of the same ball screws to rotate 1 million times (10^6rev) under the same condition without causing flaking by rolling contact fatigue.

(2) Fatigue life calculation

Fatigue life is defined as a total rotation number in general. It is sometimes indicated by total rolling hours or total running distance. Fatigue life is obtained by the following formula.

$$L = \left(\frac{C_a}{F_a \cdot f_w}\right)^3 \cdot 10^6 \qquad \cdots (\text{II-8})$$

$$L_t = \frac{L}{60n} \qquad \cdots (\text{II-9})$$

$$L_s = \frac{L \cdot l}{10^6} \qquad \cdots (\text{II-10})$$

In this formula:

- L : Rating fatigue life (rev)
- L_t : Life in hours (h)
- L_s : Life by running distance (km)
- C_a : Basic dynamic load rating (N)
- F_a : Axial load (N)
- n : Rotational speed (min^{-1})
- l : Lead (mm)
- f_w : Load factor (Coefficient by operating condition)

Load coefficients f_w in operation condition are shown in Table 5.1.

Table 5.1 Load coefficient f_w

Smooth operation without impact	1.0 – 1.2
Normal operation	1.2 – 1.5
Operation associated with impact or vibration	1.5 – 3.0

Setting too long fatigue life requires larger ball screw, and is not economical. Below are the general target values of operating life for machines. (reference)

Table 5.2 General target values of fatigue life

Machine tools	20000 hours
Industrial machines	10000 hours
Automatic control system	15000 hours
Measuring equipment	15000 hours

(3) Mean load

If the axial load varies often, to calculate a life, obtain a mean load which gives equivalent fatigue life under this varying load conditions.

①When load and rotational speed shift stepwise

Obtain the mean load F_m by the formula below.

Obtain mean rotational speed N_m by the formula below as Table 5.3, Fig. 5.1.

$$F_m = \left(\frac{F_1^3 \cdot n_1 \cdot t_1 + F_2^3 \cdot n_2 \cdot t_2 + \cdots F_n^3 \cdot n_n \cdot t_n}{n_1 \cdot t_1 + n_2 \cdot t_2 + \cdots + n_n \cdot t_n}\right)^{\frac{1}{3}} \qquad \cdots (\text{II-11})$$

$$N_m = \frac{n_1 \cdot t_1 + n_2 \cdot t_2 + \cdots + n_n \cdot t_n}{t_1 + t_2 + \cdots + t_n} \qquad \cdots (\text{II-12})$$

Table 5.3 Stepwise operation condition

Axial load (N)	Rotational speed (min^{-1})	Hours of use, or ratio of hours of use
F_1	n_1	t_1
F_2	n_2	t_2
:	:	:
F_n	n_n	t_n

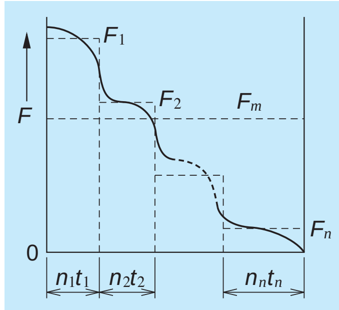

Fig. 5.1 Stepwise load variation

②When the rotational speed is constant, and the load changes linearly, obtain approximate value of the mean load F_m by the formula below.

$$F_m = \frac{1}{3}(F_{min} + 2F_{max}) \qquad \cdots (\text{II-13})$$

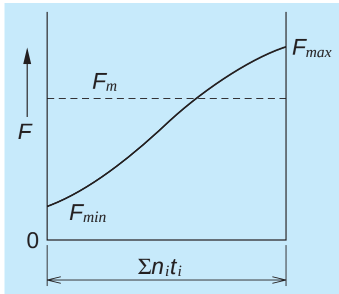

Fig. 5.2 Linear load change

③When rotational speed is constant, and the load changes in sinusoidal pattern, obtain approximate value of the mean load F_m by the formula below.

When the sine curve is Fig. (a)

$$F_m \doteqdot 0.65\,F_{max} \qquad \cdots (\text{II-14})$$

When the sine curve is Fig. (b)

$$F_m \doteqdot 0.75\,F_{max} \qquad \cdots (\text{II-15})$$

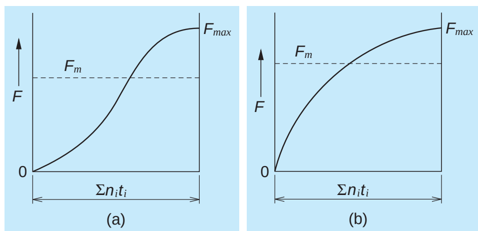

Fig. 5.3 Load changes in sinusoidal pattern

(4) Affect of mounting misalignment

If moment load or radial load is applied to the ball screw, it adversely affects ball screw function, and shortens life. Watch for eccentric load that induces moment or radial load.

Fig. 5.4 shows a calculation example of fatigue life when moment load is applied to the ball screw. In this figure, the value of the rigidity of mounting ball screw sections (screw shaft, support bearing, guide, etc.) is set at infinity. In actual use, deformation is absorbing the moment load in various areas, and the moment load that generates between the screw shaft and nut is abated.

In general, the following values are recommended as control values for precision grade.

Misalignment in inclination	··1/2000 or less
Eccentricity	························20 μm or less

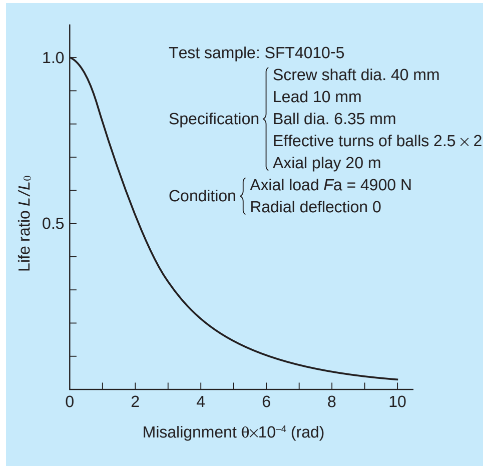

Fig. 5.4 Affects of misalignment

(5) Effects of heavy load and short stroke

If the ball screw is used under heavy load and short strokes, such as for drive of plastic injection molding machine and of press machines, the fatigue life may become significantly shorter than the rated fatigue life which is calculated in B-2-5.2.

This decreased life occurs because the heavy load generates large stress (surface pressure) in the contact point of balls and ball grooves of the screw shaft and the nut, adversely affecting the life. In such case, the life calculation should take into account the size of the surface pressure as well as the size of the stroke.

The axial load F_{amax} *1 during operation and the size of strokes, which affect fatigue life, can be obtained by the following formula.

In such case, the life calculation should take into account the size of the surface pressure as well as the size of the stroke. Please consult with NSK.

$$F_{amax} \geq 0.10C_{0a} \qquad \cdots (\text{II-16})$$

$$S \leq 4$$

In this formula:

F_{amax} : Maximum load to axial direction during drive (N)

C_{0a} : Basic static load rating (N)

S : Stroke (rev)

$$S = \frac{L_s}{l}$$

L_s : Stroke distance (mm)

l : Lead (mm)

* Axial load : The load is applied to the axial direction when screw shaft and the nut of ball screw are rotating relatively each other. The rotational speed is irrelevant.

B-2-5.3 Ball screw and Hardness

Table 5.4 indicates NSK standard ball screw and their hardness.

Table 5.4 Ball screw materials and their hardness

Component	Heat treatment method	Hardness (HRC)
Screw shaft	Carburizing	58 or over
	Induction hardening	58 or over
Nut	Carburizing	58 or over

* NSK manufactures special material ball screws for special environments (stainless steel: SUS440C, SUS630). NSK also furnishes surface treatment (Refer to Page D5). Please consult NSK for such request.

B-2-5.4 Wear Life

Wear of materials, as is the case for other mechanical components, is significantly affected by use conditions, lubrication conditions and other factors. It is difficult to estimate its volume, and measuring requires various tests and field data.

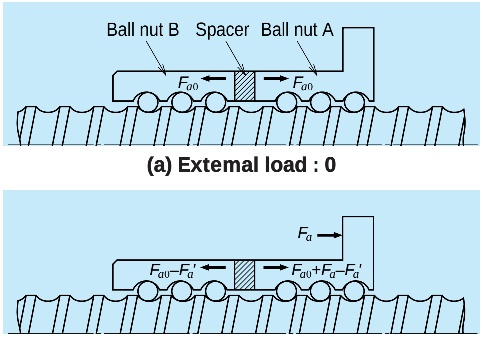
NSK has data of wear accumulated through abundant experience. Please contact NSK for inquiry pertaining to the wear.

B-2-6 Preload and Rigidity

B-2-6.1 Elastic Deformation of the Preloaded Ball Screw

(1) Position preload (D, Z, P preloads)

Double nut preload ball screw shown in Fig. 6.1.



(b) Extemal load : F_a

Fig. 6.1 Position preload (double-nut)

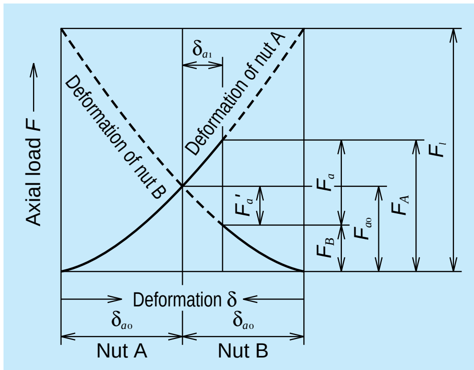


Fig. 6.2 Deformation of A and B nut (position preload)

Elastic deformation of Nut A and B is already given at time of assembly by the amount of δao by preload F_{ao}. When the external load F_a is added to Nut A, the elastic deformation δ_a and δ_b of each Nut A and B change as shown in Fig. 6.2,

$$\delta_a = \delta_{ao} + \delta_{a1} \qquad \delta_b = \delta_{ao} - \delta_{a1}$$

At this time, the load to each Nut A and B are:

$$F_A = F_{ao} + F_a - F_a'$$

$$F_B = F_{ao} - F_a'$$

It shows that the load applied to Nut A is affected by Nut B and reduced by the amount of F_a'. Thereby, the elastic deformation of Nut A becomes smaller. This effect continues until the elastic deformation by the external load becomes δ_{ao}, and the preload by Nut B disappears.

Assuming that the load when the preload is absorbed is F_l, the relationship between the axial load and the elastic deformation is as follows. (Fig. 6.2)

$$\delta_{ao} = K \cdot F_{ao}^{2/3} \qquad 2\delta_{ao} = K \cdot F_l^{2/3}$$

(K : Invariable number)

$$\left[\frac{F_l}{F_{ao}}\right]^{2/3} = \frac{2\delta_{ao}}{\delta_{ao}} = 2$$

$$F_l = 2^{3/2} \times F_{ao} \fallingdotseq 3F_{ao}$$

For this reason, the preload should be about 1/3 of the maximum axial load. Please note that the preload of about 1/3 of the maximum axial load increases heat, and shortens life if it exceeds 10% of C_a. The criterion for the maximum preload is 0.1 C_a.

Fig. 6.3 shows two types of elastic deformation curves: one is by the ball screw with preload, the other without preload. When an axial load which is about three times as large as the preload is applied, the deformation of the preloaded ball screw is 1/2 of the deformation of the ball screw without preload.

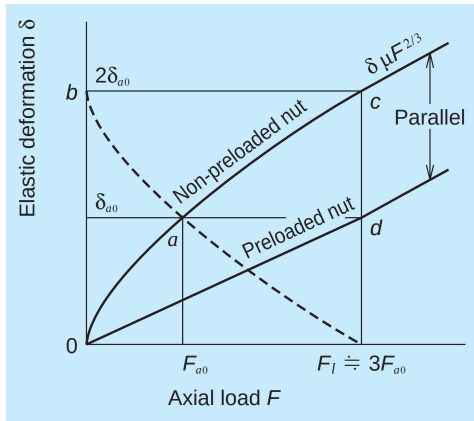

Fig. 6.3 Deformation of preloaded ball nut (position preload)

(2) Constant pressure preload (J preload: preloaded by spring)

Fig. 6.5 shows an elastic deformation of the ball screw which is preloaded with "constant pressure." The rigidity of the preload spring is sufficiently smaller than the nut rigidity. Therefore, the deformation of the spring becomes nearly parallel to the axis of abscissa. For this reason, the elastic deformation by the preload with constant pressure changes along the deformation curve by Nut A.

In order to take advantage of the characteristics of the preload with constant pressure, the major external load should be applied in the directions shown by arrows (Fig. 6.4.).

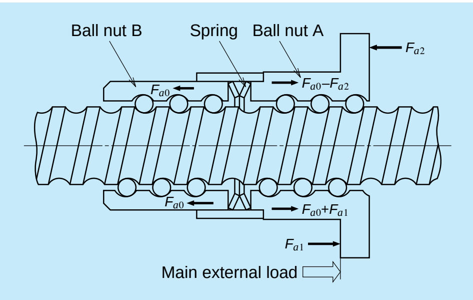

Fig. 6.4 Constant pressure preload (double nut)

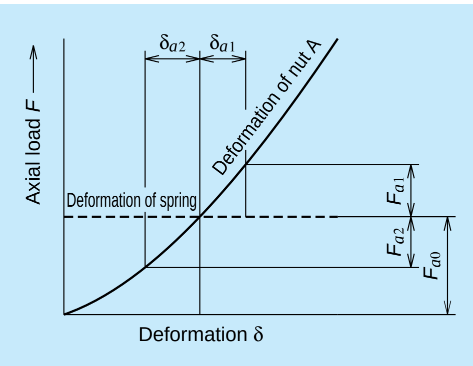

Fig. 6.5 Deformation curve of constant pressure preloaded nut

B-2-6.2 Rigidity of the Feed Screw System

A low rigidity around the feed screw mounting area causes lost motion. To improve the positioning accuracy of precision machines such as NC machine tools, it requires a good balance in axial rigidities of composing parts of the feed screw system.

Also should examine torsional rigidities of the feed screw system.

(1) Axial rigidity of the feed screw system K_T

Elastic deformation and rigidity of the feed screw system can be obtained by the following formula.

$$\delta = \frac{F_a}{K_T} \quad \cdots\cdots (\text{II-17})$$

$$\frac{1}{K_T} = \frac{1}{K_S} + \frac{1}{K_N} + \frac{1}{K_B} + \frac{1}{K_H} \quad \cdots\cdots (\text{II-18})$$

In this formula:

- δ : Volume of axial elastic deformation of the feed screw system (μm)
- F_a : Axial load to the feed screw system (N)
- K_T : Axial rigidity of the feed system (N/μm)
- K_S : Axial rigidity of the screw shaft (N/μm)
- K_N : Axial rigidity of the nut (N/μm)
- K_B : Axial rigidity of the support bearing (N/μm)
- K_H : Axial rigidity of the nut and bearing mounting section (N/μm)

(2) Axial rigidity of the screw shaft: K_S

(a) In case of: Fixed support - Free (axial direction)

$$K_S = \frac{A \bullet E}{x} \times 10^{-3} \quad \cdots\cdots (\text{II-19})$$

In this formula:

- K_S : Axial rigidity of the screw shaft (N/μm)
- A : Cross section area of the screw shaft (mm^2)

$$A = \frac{\pi}{4} dr^2$$

- dr : Screw shaft root diameter (mm)
- E : Elastic modulus ($E = 2.06 \times 10^5$ MPa)
- x : Distance between points of load application (mm)

(b) In case of: Fixed – Fixed support (axial direction)

$$K_S = \frac{A \bullet E \bullet L}{x\,(L - x)} \times 10^{-3} \quad \cdots\cdots (\text{II-20})$$

In this formula:

- K_S : Axial rigidity of the screw shaft (N/μm)
- L : Unsupported length (mm)
- x : Axial deformation is maximum at position $x = L/2$.

Axial rigidity of the screw shaft can be obtained by the following formula.

$$K_S = \frac{4A \bullet E}{L} \times 10^{-3} \quad \cdots\cdots (\text{II-21})$$

<<Axial rigidity example of calculation (1)>>

$$A = \frac{\pi}{4} d_r^2 = \frac{3.14}{4} \times 34.4^2 = 929.4 \ (\text{mm}^2)$$

$$K_S = \frac{A \bullet E}{x} \times 10^{-3} = \frac{929.4 \times 2.06 \times 10^5}{1200} \times 10^{-3} = 159 \ (\text{N/μm})$$

$$K_S = \frac{4A \cdot E}{L} \times 10^{-3} = \frac{4 \times 929.4 \times 2.06 \times 10^5}{1200} \times 10^{-3} = 638 \text{ (N/µm)}$$

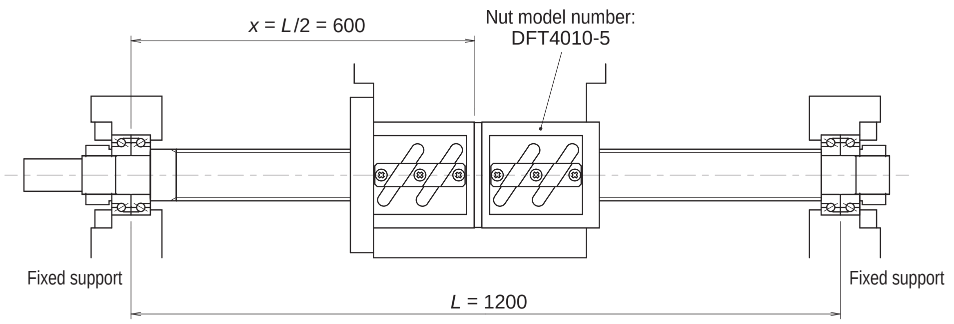

Fig. 6.7 Axial rigidity of the screw shaft calculation example (2)

(3) Axial rigidity of the ball nut : K_N

(a) Rigidity of the nut with axial play

Theoretical rigidity value K is shown in the dimension table. K is obtained from the elastic deformation between screw grooves and balls when an axial load which is equivalent to 30% of the basic dynamic load rating C_a is applied. The criterion for calculation of ball nut rigidity is 80% of the value listed in the table taking into consideration of deformation of the ball nut, etc. Rigidity value K_N is obtained by the following formula when the axial load "F_a" is not 30% of "C_a."

$$K_N = 0.8 \times K \left(\frac{F_a}{0.3\,C_a}\right)^{1/3} \text{ (N/µm)} \qquad \text{(Ⅱ-22)}$$

In this formula:

K : Rigidity value in dimension tables (N/µm)

F_a : Axial load (N)

C_a : Basic dynamic load rating (N)

<<Axial rigidity example of calculation (3)>>

Obtain axial rigidity of the nut under the following conditions.

<Use conditions>

Nut model: SFT 4010-5

Axial load: F_a = 6000 N

F_a = Rigidity at 0.3 C_a K = 706 N/µm

(From the dimension table)

<Calculation>

By Formula Ⅱ-22, axial rigidity K_N is :

$$K_N = 0.8 \times K \left(\frac{F_a}{0.3 \cdot C_a}\right)^{1/3}$$

$$= 0.8 \times 706 \times \left(\frac{6000}{0.3 \times 52000}\right)^{1/3}$$

$$= 410 \text{ (N/µm)}$$

(b) Rigidity of preloaded ball nut

Theoretical rigidity K is shown in each dimension table. K is obtained from the elastic deformation of the ball rolling surface and the balls when: a preload which is equivalent to 10% of the basic dynamic load rating C_a (P Preload. 5% for single-nut oversize ball pre-load system) is applied, followed by an axial load. The criterion for calculation of nut rigidity is 80% of the value listed in the table taking into consideration of deformation of the ball nut, etc. Rigidity K_N is obtained by the following formula when preload "F_{a0}" is not 10% (or 5%) of "C_a".

$$K_N = 0.8 \times K \left(\frac{F_{a0}}{\varepsilon \cdot C_a}\right)^{1/3} \text{ (N/µm)} \qquad \text{(Ⅱ-23)}$$

In this formula:

K : Rigidity in the dimension tables (N/µm)

F_{a0} : Preload (N)

ε : Basic factor to calculate rigidity (ε = 0.1. Use 0.05 for P Preload)

<<Axial rigidity of the screw shaft calculation example (4)>>

F_{a0} = Rigidity when εC_a: K = 1388 N/µm

(From the dimension table)

Basic factor to calculate rigidity when D Preload: ε = 0.1

<Calculation>

By Formula Ⅱ-23

$$K_N = 0.8 \times K \left(\frac{F_{a0}}{\varepsilon \cdot C_a}\right)^{1/3}$$

$$= 0.8 \times 1388 \times \left(\frac{4000}{0.1 \times 52000}\right)^{1/3}$$

$$= 1017 \text{ (N/µm)}$$

The criterion of the preload to ball screw

Nut rigidity increases by a larger preload volume. But excessive preload shortens life, and generates heat. Set the maximum preload about at 0.1 C_a (0.05 for *P* Preload). Table 6.1 shows the criteria for preload for different application.

Table 6.1 Criteria of preload

Ball screw application	Preload (relative to dynamic load rating C_a)
Robots,material handling systems, etc.	Axial play or under 0.01 C_a
Semiconductor manufacturing systems, etc. That require highly accurate positioning	0.01 C_a – 0.04 C_a
Medium- high-speed machine tools for cutting	0.03 C_a – 0.07 C_a
Low to medium-speed systems that require especially high rigidity	0.07 C_a – 0.1 C_a

(4) Axial rigidity of support bearing: K_B

Rigidity of the combined thrust angular contact ball bearings which is widely used as a support bearing of the ball screw for high-precision equipment can be obtained by the following formula.

$$K_B \doteqdot \frac{3F_{a0}}{\delta_{a0}} \text{ (N/μm)} \qquad (\text{Ⅱ-24})$$

In this formula:

K_B : Rigidity of the combined thrust angular contact ball bearings (N/μm)

F_{ao} : Preload of the bearings (N)

δ_{ao} : Axial elastic deformation by preload (μm)

$$\delta_{a0} \doteqdot \frac{0.44}{\sin\alpha}\left(\frac{Q^2}{D_w}\right)^{1/3} \text{ (μm)} \qquad (\text{Ⅱ-25})$$

$$Q = \frac{F_{a0}}{Z} \cdot \sin\alpha$$

α : Contact angle

D_w : Ball diameter (mm)

Z : Number of balls

Refer to Page B457 for data regarding thrust angular contact ball bearings which support high-precision ball screws (TAC Series).

(5) Axial rigidity of the ball nut and bearing mounting section: K_H

The effect of rigidity of mounting section on positioning accuracy is big, we recommend incorporating high rigidity of the mounting sections of ball nut and support bearings into the design at the early stage of designing the machine.

(a) Torsional rigidity of the feed screw system

Major torsion factors in the rotating system that bring about error in positioning accuracy are given three points below.

- Torsional deformation of the screw shaft
- Torsional deformation of the joint section
- Torsional deformation of the motor

The value of the effect of torsional strain to positioning accuracy is smaller than axial deformation. However, check the effect when designing equipment that requires high positioning accuracy.

(b) Suppress thermal error

It is necessary to minimize the thermal error for ever increasing demand for positioning accuracy give three points below.

- Suppress heat
- Forced cooling
- Avoid effect of temperature rise

Refer to "Measures against thermal expansion" on Page B44.

B-2-7 Friction Torque and Drive Torque

Operations that use ball screw drives require a motor torque which is equivalent to the total of two:

- Friction torque, i.e. the friction of the ball screw itself
- Drive torque which is required for operation

B-2-7.1 Friction Torque

(1) Starting friction torque (Break away torque)

A large torque is necessary to start ball screw. This is called "starting friction torque" or "brakeaway torque." This torque is 2 to 2.5 times larger than preloaded dynamic (friction) torque which is described below. Starting friction torque quickly diminishes once the ball screw begins to move.

(2) Dynamic preloaded drag torque (preloaded dynamic friction torque)

When the ball screw is moving, two types of torque generate: 1. Dynamic friction torque by preload; 2. Friction torque associated with ball recirculation. JIS B1192 sets standard of dynamic preloaded torque, which is the total of these two torque types. They are defined in Fig. 7.1.

The preload dynamic friction torque is calculated by following formula. When screw shaft is rotated as Fig. 7.2 in following measure condition, measuring the nut stop power *F* and the distance from action line and right angle direction to the measured screw shaft multiple by it's power value *F*.

$$T_p = F \cdot L \qquad (\text{Ⅱ-26})$$

- Measuring rotational speed 100 min^{-1}
- Viscosity of lubrication is prescribed in JIS K 2001 ISO VG 68
- Without measurement Seal

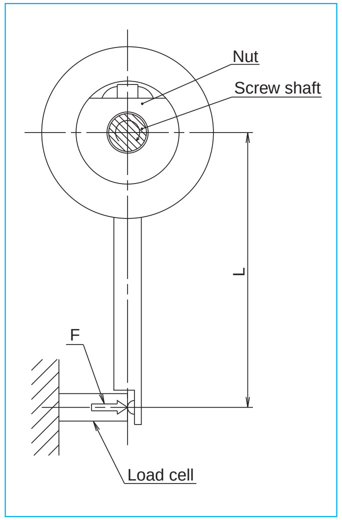

Fig. 7.2 Preload dynamic torque measuring method

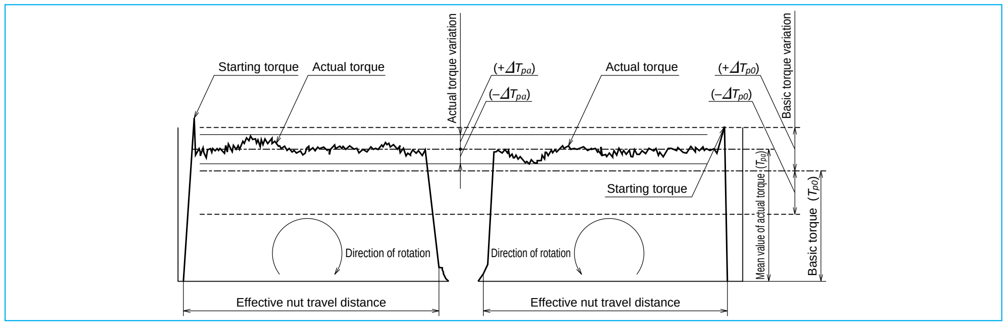

Fig. 7.1 Definitions of dynamic preloaded drag torque

(3) Calculation of basic torque

Basic torque of preloaded ball screw T_{p0} can be obtained by the following formula.

$$T_{p0} = K \frac{F_{a0} \bullet l}{2\pi} \fallingdotseq 0.014 F_{a0} \sqrt{dm \bullet l} \quad (\text{N} \cdot \text{cm}) \qquad (\text{II-27})$$

In this formula:

F_{a0} : Preload (N)

l : Lead (cm)

K : Torque coefficient of ball screw

$$K = \frac{0.05}{\sqrt{\tan\beta}}$$

β : Lead angle (deg.)

d_m : Ball pitch circle diameter (cm)

Allowable values of torque variation rate relative to basic torque are regulated as shown in Table 7.1.

B-2-7.2 Drive Torque

(1) Operating torque of the ball screw

① Normal drive

The torque when converting rotational motion to linear motion (normal operation) is obtained by the following formula.

$$T_a = \frac{F_a \bullet l}{2\pi \bullet \eta_1} \quad (\text{N} \cdot \text{cm}) \qquad (\text{II-28})$$

In this formula:

T_a : Normal operation torque (N · cm)

F_a : Axial load (N)

l : Lead (cm)

η_1 : Normal efficiency ($\eta_1 = 0.9 – 0.95$)

② Back-drive operation

The torque when converting linear motion to rotational motion (back-drive operation) is obtained by the following formula.

$$T_b = \frac{F_a \bullet l \bullet \eta_2}{2\pi} \quad (\text{N} \cdot \text{cm}) \qquad (\text{II-29})$$

In this formula:

T_b : Reverse operation torque (N · cm)

η_2 : Reverse efficiency ($\eta_2 = 0.9$ - 0.95)

③ Dynamic drag torque of the preloaded ball screw

Operation torque of preloaded ball screw can be obtained by Formula II-27.

630	1000	—	±15%	±15%	±20%	—	—	±20%	±25%	—	±25%	±30%

Remarks 1. Slenderness ratio: The value obtained by dividing the length of the screw thread section of screw shaft (mm) by diameter of the screw shaft (mm).
2. NSK independently sets torque standards which are under 20 N · cm.

(2) Drive torque of the motor

① Drive torque at constant speed

Torque which is necessary to drive a ball screw at constant speed resisting to external loads can be obtained by the following formula.

$$T_1 = (T_a + T_{pmax} + T_u) \times \frac{N_1}{N_2} \qquad (\text{II-30})$$

In this formula:

T_a : Drive torque at constant speed

$$T_a = \frac{F_a \bullet l}{2\pi \bullet \eta_1} \qquad (\text{II-28})$$

F_a : Axial load (N)

The value of F_a in Fig. 7.3 is:

$F_a = F + \mu \bullet m \bullet g$

F : Such as cutting force to axial direction (N)

μ : Friction coefficient of the guide way

m : Volume of the traveling section (table mass plus work mass kg)

g : Gravitational acceleration (9.80665 m/s^2)

T_{pmax} : Upper limit of the dynamic friction torque of ball screw (N · cm)

T_u : Friction torque of the support bearing (N · cm)

N_1 : Number of teeth in Gear 1

N_2 : Number of teeth in Gear 2

Generally, though it depends on the type of motor, T_1 shall be kept under 30% of the motor rating torque.

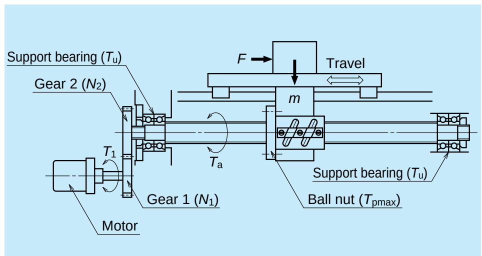

Fig. 7.3 Driving mechanism of ball screw

② Drive torque at acceleration

Accelerating the ball screw resisting axial load requires maximum torque. Drive torque necessary for this occasion can be obtained by the following formula.

$$T_2 = T_1 + J \bullet \dot{\omega} \qquad (\text{II-31})$$

$$J = J_M + J_{G1} \left(\frac{N_1}{N_2}\right)^2 \left[J_{G2} + J_S + m \left(\frac{l}{2\pi}\right)^2 \right] \quad (\text{kg} \cdot \text{m}^2) \qquad (\text{II-32})$$

In this formula:

T_2 : Maximum drive torque at time of acceleration (N · m)

$\dot{\omega}$: Motor's angular acceleration (rad/s^2)

J : Moment of inertia applied to the motor (kg · m^2)

J_M : Moment of inertia of the motor (kg · m^2)

J_{G1} : Moment of inertia of Gear 1 (kg · m^2)

J_{G2} : Moment of inertia of Gear 2 (kg · m^2)

J_S : Moment of inertia of the screw shaft (kg · m^2)

When selecting a motor, it is necessary to examine the maximum torque of the motor relative to maximum drive torque T_2 at time of acceleration of ball screw.

Calculation of the moment of inertia of a cylindrical object (ball screw, gear, etc.), please refer to below.

Formula for the moment of inertia of a cylindrical object

$$J = \frac{\pi \bullet \gamma}{32} D^4 \bullet L \ (\text{kg} \cdot \text{cm}^2) \qquad (\text{II-33})$$

In this formula:

γ : Material density (kg/cm^3)

D : Diameter of the cylindrical object (cm)

L : Length of the cylindrical object (cm)

B-2-8 Even Load Distribution in Ball Nut

Generally, the distribution of loaded balls in a ball nut is three-dimensionally asymmetric, thus resulting in uneven load distribution to the balls and ball nut. NSK has taken the measures for even load distribution to the balls by an optimal arrangement of the position of ball recirculation circuits.

Additionally, a heavier load results in a measurable axial deformation of the screw shaft and the ball nut, thus further increasing the unevenness of load distribution. We have lessened the unevenness of load distribution to the balls by arranging the load acting point of the ball nut and the screw shaft opposite to each other. The relation between loading points and load distribution is shown in Fig. A, while Table B shows the result of load distribution analysis.

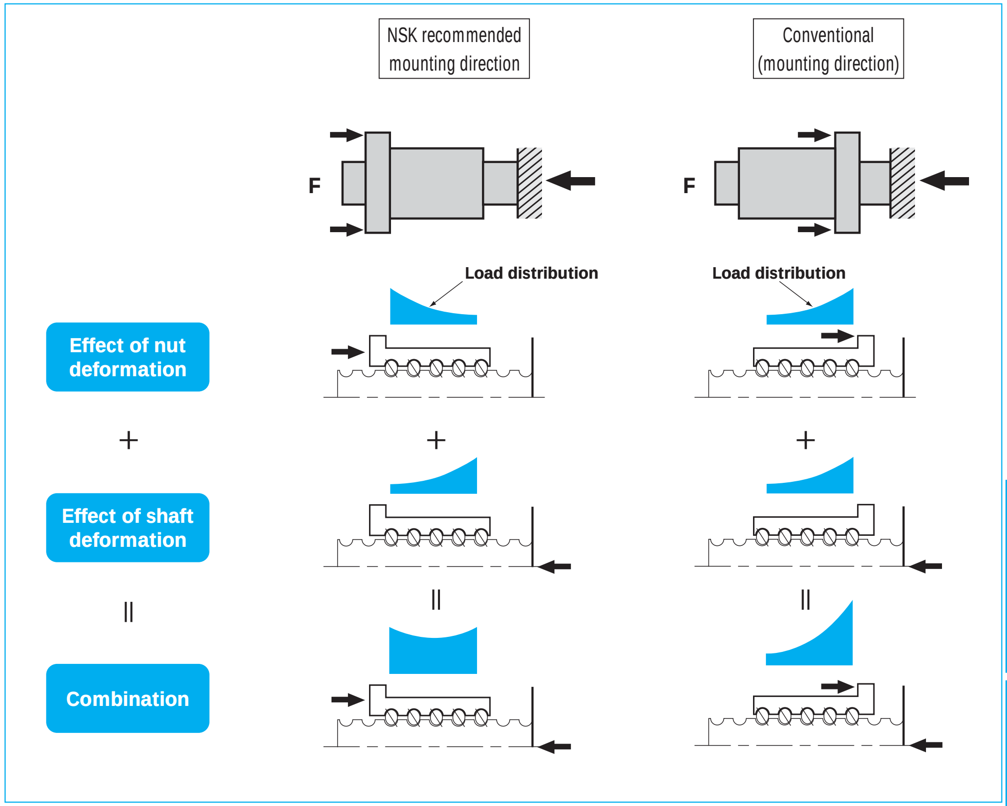

Fig. 8.1 The relationship between acting point of load and load distribution

B-2-9 Lubrication of Ball Screw

Lithium soap-based grease at viscosity 30 to 140 mm^2/s (40°C) is used for grease lubrication. Oil with ISO VG 32 to 100 is used for oil lubrication.

In general, lubricants with low base oil viscosity are recommended when the ball screw is used for high speed, and it is important to reduce thermal elongation of the screw shaft. On the other hand, lubricants with high base oil viscosity are recommended when the ball screw is used for low speed, high temperature, with vibration, or under high load.

Please consult NSK about greases for high-load drive and high-temperature applications.

NSK Grease Unit for ball screw lubrication includes:

1) Various types of grease in the bellows-tube which can be instantly attached to the grease pump;

2) Hand grease pump which is compact and easy to use;

3) Nozzles.

Table 9.1 shows NSK greases, and names of other ball screw greases.

Table 9.2 explains checking points in lubrication and standard intervals between replenishments.

It is important to wipe off old grease from the screw shaft prior to applying new grease. Page D16 also explains in detail concerning the replenishing methods.

Table 9.1 Grease for ball screw

Product name	Thickener	Base oil	Base oil viscosity mm^2/s (40°C)	Range of temperature for use (°C)	Application
NSK Grease AS2	Lithium base	Mineral oil	130	–10 – 110	General heavy load
NSK Grease PS2	Lithium base	Synthetic oil combined with mineral oil	15	–50 – 110	Light load
NSK Grease LR3	Lithium base	Synthetic oil	30	–30 – 130	High-speed medium load
NSK Grease NF2	Urea composite type	Synthetic oil combined with mineral oil	27	–40 – 130	Fretting resistant

*Refer to Page D13 for the nature of NSK greases.

Table 9.2 Checking lubricant and intervals of replenishment

Lubricating method	Checking intervals	Check points	Replenish/replacing interval
Intermittent automatic oil supply	Once a week	Remaining volume, contamination	Supply oil when checking (depending on the tank volume)
Grease	2 – 3 months after start of use	Clean, foreign matters	Generally once a year (replenish when necessary)
Oil bath	Every day, when start to work	Oil level	Specify according to oil consumption

B-2-10 Dust Prevention for Ball Screw

If foreign matters enter inside the ball nut, all screw may wear rapidly, or it may malfunction due to damage of groove or ball recirculation system. Use bellows and telescopic pipe (Fig. 10.1) to keep foreign matters from entering into the feed screw system. Install these items so as to shut foreign matters completely from the ball screw.

Also it is even more effective to add seal on the ball nut as shown in Fig. 10.2 to10.6. We provide seals in Table 10.2.

B-2-11 Rust Prevention and Surface Treatment of Ball Screws

(1) Stainless steel ball screw

Stainless products KA is standard ball screw and available in stock. Please consult NSK if you require custom made stainless steel ball screw.

(2) Types of surface treatment

The following are common types of treatment.

◯Low temperature chrome plating

- Used to prevent corrosion and light reflection, and for cosmetic purpose.

◯Fluoride low temperature chrome plating

- Fluoroplastic coating is provided following the low temperature chrome plating.
- Resistance to corrosion is higher than low temperature chrome plating.

◯Hard chrome plating

- Has high hardness. Increases resistance to both wear and corrosion.

◯Electroless nickel plating

- Creates a film of consistent thickness on complex shaped items.
- For corrosion prevention.

(3) Recommended surface treatment

Among the surface treatments mentioned above, we recommend "Low temperature chrome plating" and "fluoride low temperature chrome plating" for rust prevention because of the result of humidity chamber test for antirust characteristics.

However, never apply any organic solvent for degreasing because it has adverse effect on antirust characteristics.

Table 11.1 Surface treatment length

	Applicable length
Low temperature chrome plating	5 m or less
Fluoride low temperature chrome plating	4 m or less

Refer to 1.3 "Rust Prevention and Surface Treatment" (Page D5) for the results of humidity chamber test.

B-2-12 Ball Screw Specifications for Special Environment

B-2-12.1 Clean Environment

NSK manufactures NSK Clean Grease "LG2 and LGU" for NSK linear guides, ball screws, and Monocarriers which are used under normal temperature and pressure in a clean room.

LG2 and LGU grease are far more superior in stable torque characteristics than the vacuum grease which has been used as a countermeasure against dust generation. LG2 and LGU also have a sufficient durability and dust prevention capability.

Features of "LG2 and LGU"

① Generates less dust than vacuum grease and other general greases. Cleanliness is enhanced by simply switching the grease to LG2 or LGU.

② Has extremely low and stable torque characteristics. It is ideal for high speeds.

③ Unlike vacuum grease, LG2 and LGU have a nature similar to general grease. Its effect is long-lasting, and sufficiently durable. They greatly contribute to minimize the frequency of maintenance.

④ They have an equal capability in rust prevention as general grease, and also is reliable.

When using NSK linear guides, ball screws, or Monocarriers in a clean environment, request LG2 or LGU as a packed lubricant prior to delivery. NSK also makes bellows-tubes which contain 80 grams of LG2 or LGU. The tube is easy to use, and is ideal for maintenance. (Refer to Pages B455 and D20). Wash to remove adipose substances prior to use.

Refer to Page D8 for detailed nature, functions and characteristics of LG2 and LGU.

B-2-12.2 Measures for Use under Vacuum

NSK developed MoS_2 / WS_2 spattering and dry-filmed ball screws for equipment to be used in space. NSK also makes soft-metal film (gold and silver) ball screws to be used in a vacuum environment for semiconductor and liquid crystal display processing equipment.

Lubricants widely used for ball screws in a high vacuum are:

- Vacuum grease which uses base oil of low vapor pressure.
- Solid lubricants such as MoS_2, WS_2 used mainly for equipment in space.
- Solid lubricants by soft-metal such as gold, silver, or lead film.

When used for semiconductor and liquid crystal display making equipment, the oil of the vacuum grease evaporates and causes environmental contamination. Also, it hinders creation of a super high vacuum. MoS_2 in the state of solid lubricant generates a large volume of dust, and Mo is unsuitable for semiconductors and reformed surface. Therefore, it is not suitable for the processing machines for semiconductor and liquid crystal display.

NSK recommends solid lubricant ball screws with a long life. These ball screws are treated with special silver film by NSK's unique processing technology, and can be used in a super-high vacuum. However, because of a solid lubricant, the film may peal off and stick to surface of ball grooves repeatedly, causing the torque to rise momentarily on some occasions. The drive motor should be of large capacity to handle this drastic variation of torque.

Refer to Page D7 for test data of ball screws for vacuum.

For ball screw specifications for special environment, refer to Page D2.

B-2-13 Noise and Vibration

B-2-13.1 Consideration to Lowering Noise

As the machine operates at higher speeds, noise levels tend to increase. Covering the nut section is insufficient to lower noise. NSK has abundant data (NSK Motion & Control Technical Journal No.4, etc.), and offers advice to users regarding selecting ball screw.

To lower noise level in general, the following points should be taken into consideration.

① Use as a large lead as possible to reduce rotational speed.

② Use a ball screw with smaller outer diameter as possible.
(It often requires designing for critical dimensions, mandating special specification. Please consult NSK.)

For reference, noise levels by ball screws alone are plotted below. Formula for calculation is also shown below.

①Average value at measuring distance of 400 mm

$$\text{dB (A)} = 25.2\,\{\log_{10}(D_w \cdot d_m \cdot n \times 10^{-5})\} + 63.9 \qquad (\text{II-34})$$

②Upper limit at measuring distance of 400 mm

Average value + 6 dB (A)

D_w : Ball diameter (mm)

d_m : Ball pitch circle dia. (mm)

n : Rotational speed (min^{-1})

If measuring distance is 1 m, the average noise level is: Various noise levels minus 8 dB (A).

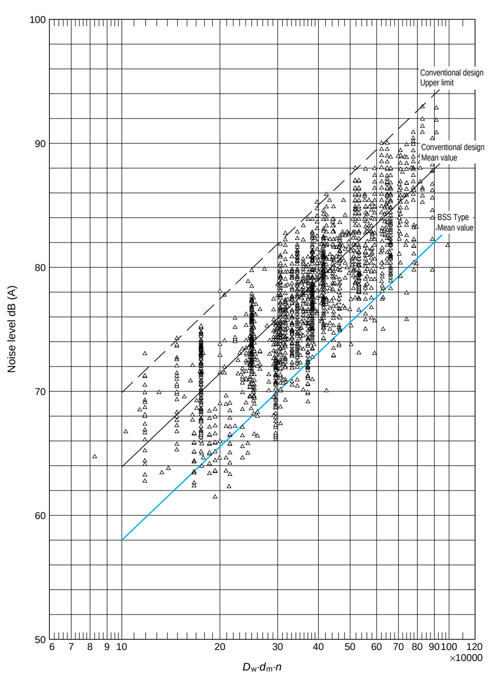

Fig. 13.1 Noise levels of ball screws

<<Example of calculation of noise levels>>

<Use conditions>

Nut model: DFT4010-5

From the dimension table: D_w = 6.350, d_m = 41

Maximum rotational speed: 2000 min^{-1}

<Calculation>

By Formula II-34:

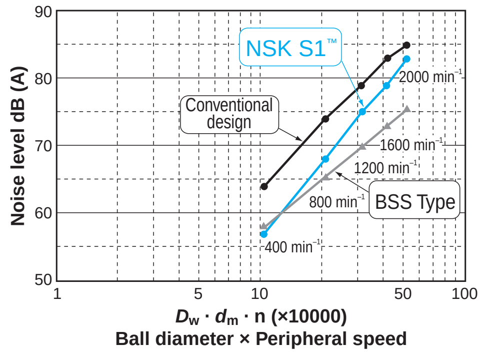
$$\text{dB (A)} = 25.2\,\{\log_{10}(D_w \cdot d_m \cdot n \times 10^{-5})\} + 63.9$$
$$= 25.2\,\{\log_{10}(6.350 \times 41 \times 2000 \times 10^{-5})\} + 63.9$$
$$= 82 \text{ dB (A)}$$

The average value of noise level by ball screws alone at maximum rotational speed (measuring distance 400 mm) is 82 dB (A). Upper limit is: 82 dB (A) + 6 dB (A) = 88 dB (A)

If the measuring distance is 1 m, the average value of noise level is 74 dB (A), and upper limit is 80 dB (A).

When installed, the noise of ball screw becomes higher by the noise of the machine and characteristics of machine vibration.

By using NSK S1, the noise is reduced and softened compared to conventional ball screws. The BSS type will furthermore reduce and soften the noise.



B-2-13.2 Consideration to operatical characteristics

Smooth motion is achieved by using spacer balls on conventional ball return tube type ball screws. By using NSK S1 the smoothness is further improved. BSS type will achieve the smoothness equivalent to Ball screws with NSK S1.

B-2-13.3 Consideration to Ball Screw Support System

Ball screw has low radial rigidity because its support span is longer compare to its shaft diameter. It has only small damping capacity, requiring as much support rigidity as possible through design.

Simplify support bearing system to cut costs invites noise and vibration problems. Therefore, the necessity to consideration to ball screw support system of both shaft ends is increasingly becoming important as the machine is operated at higher speeds.

If one shaft end must be left unfixed without support bearing due to structural reasons, noise and vibration problems may occur. These problems are related to the natural vibration frequency of the screw shaft on the unsecured end. This problem can be averted by installing an impact damper to the shaft end (Fig. 13.2). Please consult NSK.

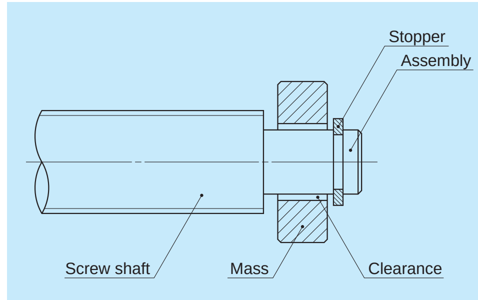

Fig. 13.2 Impact damper (NSK patent)

B-2-14 Installation of Ball Screw

B-2-14.1 Installation

Follow the flowchart in Figure 14.1 for installation procedures.

(1) Centering of the units

Align the centers of housings for the ball nut and the support bearing to which a ball screw is fixed. The centering is critical for life, smooth operation, and positioning accuracy of a ball screw.

We generally recommend the centering accuracy as follows for a precision grade ball screw.

• Inclination of center line: 1/2 000 or less (Target: 1/5 000 or less)

• Eccentricity: 0.020 mm or less

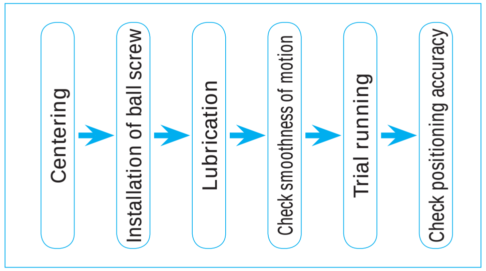

Fig. 14.1 Flowchart of ball screw installation

(2) Centering of ball nut housing

Photo 14.1 shows a centering procedure of the ball nut housing. Insert a jig (test bar) that has close fit clearance to a bore of the ball nut housing. Check vertical and horizontal parallelism of the test bar against the guide way (such as linear guides) with the dial indicator, that is fixed on the guide way bearing, and adjust the position of the housing so that the inclination of the center sets in 1/2 000 or less, and then, fix the housing to the table base.

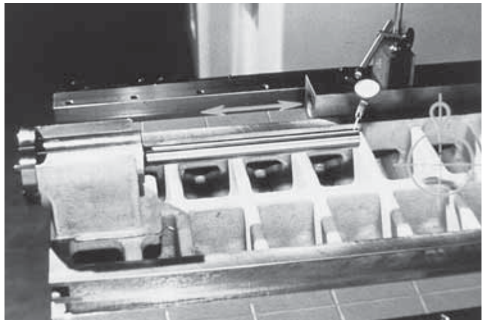

Photo 14.1 Centering of ball nut housing

(3) Centering of the housing of support bearing

Photo 14.2 shows a centering procedure of the housing of support bearing. As the same way of the ball nut housing, set the jig (test bar) that has close fit clearance to bore of the housing and adjust the position of the housing so that the aligning inclination sets in 1/2 000 or less, then fix the housing to the table temporarily.

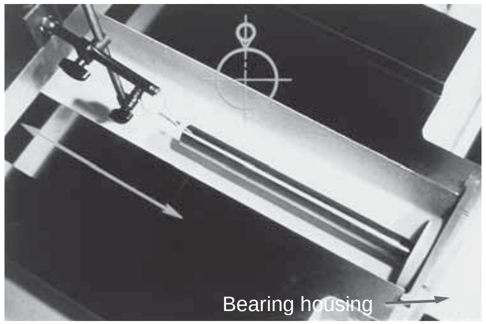

Photo 14.2 Centering of the housing of support bearing

(4) Eccentricity of the housings

Measuring way of eccentricity between the two housings is shown in Figure 14.3. Set the table on the guide way (such as linear guides, etc), and fix a dial indicator on it. Check eccentricity of the test bar of support bearing housing against the test bar of ball nut housing. Adjust position of support unit housing so that the eccentricity gets in 0.020 mm or less, then fix the housing of support bearing.

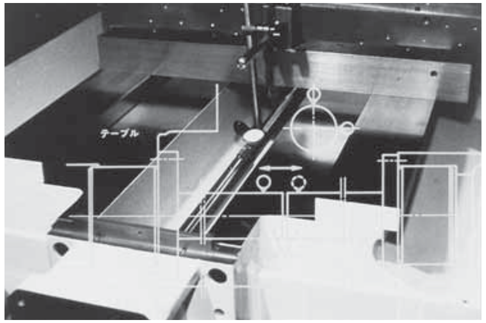

Photo 14.3 Eccentricity of the housings

(5) Installation of ball nut

Photo 14.4 shows a procedure for installation of the ball nut to the housing. Wipe off outside of the ball nut and bore of the housing with thin rags. (Applying a small amount of machine oil with low viscosity to both parts is effective in rust prevention.) Insert the ball nut to the housing while holding the ball screw in horizontal position and fix it. Do not handle the ball screw roughly, like hammering ends of the ball screw, because it may induce failure of the ball screw.

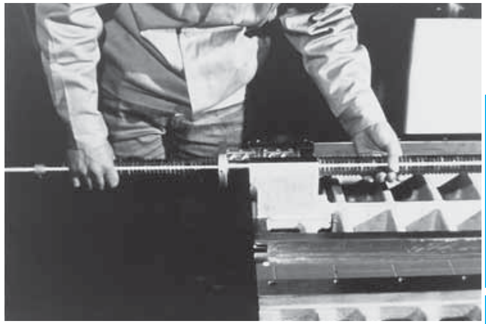

Photo 14.4 Installation of ball nut

(6) Installation of support bearings in ball screw

Photo 14.5 shows a procedure for installation of support bearings. Select bearings that have appropriate fitting tolerance to the screw shaft, then install them. We recommend using a special sleeve as shown in the photo not to apply impact to the bearings.

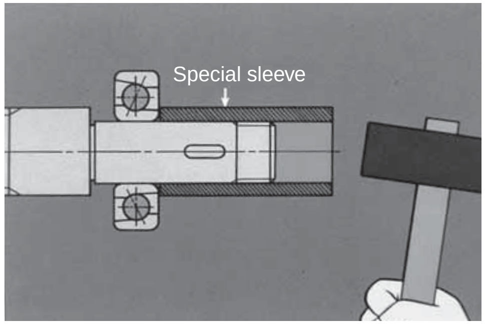

Photo 14.5 Installation of support bearings in ball screw

(7) Installation of bearings in the housing

Photo 14.6 shows the procedure for installing the support bearings to the bearing housing. When fixing the bearing with a lock nut, tighten the lock nut with specified tightening torque while checking run-out of screw shaft end. Take measures against loose lock nut. (Refer to assembly procedure of support bearing unit. Page B81)

For easy installation work of ball screws, NSK provides Support Unit (Page B433 to B452) that consists of bearings and Bearing Lock Nuts (Page B453) of which surface run-out is made to a specification.

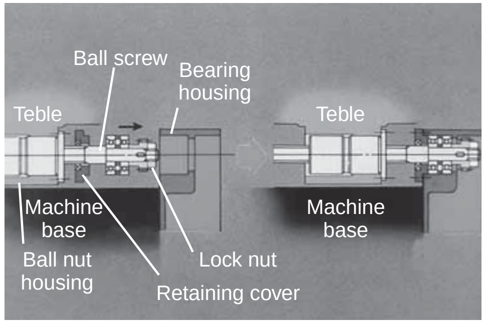

Photo 14.6 Installation of bearings

(8) Replenish lubrication grease

Photo 14.7 shows the replenishing procedure of lubrication grease. Applying grease prior to its operation is not necessary when the grease is packed into the ball nut. Please confirm it.

If grease is not used, we apply antirust oil to ball screws when shipping. Wipe off the oil and pack grease fully into the ball nut as shown in the photo.

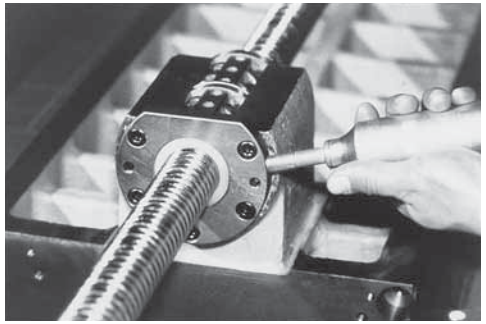

Photo 14.7 Replenish lubrication grease

(9) Check motion smoothness

Photo 14.8 shows a checking procedure for motion smoothness. This is to confirm if the table is assembled accurately. Use a torque wrench to measure starting torque of the ball screw for full stroke of the table. Check for abnormality in starting torque as well as unevenness of rotation by feeling.

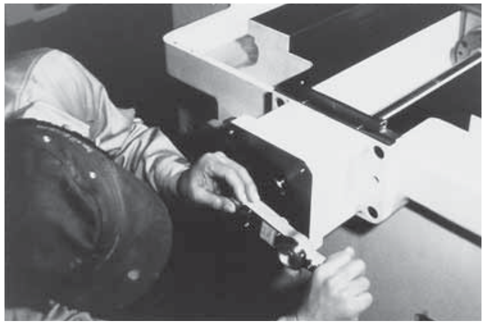

Photo 14.8 Check motion smoothness

(10) Trial operation

Photo 14.9 shows a seen of trail operation. Firstly operate the machine slowly and check noise and vibration, then do the same at medium and high speed. Operate the machine continuously for approximately 2 hours as a running in, and check for abnormality meanwhile. Remove over flown grease from the ball nut after a running in.

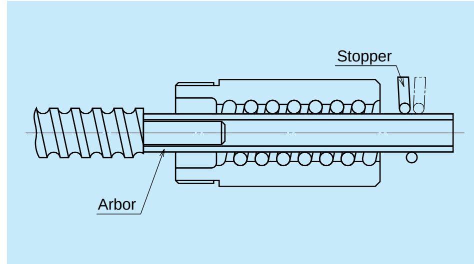

Fig. 14.2 Inserting nut into screwshaft

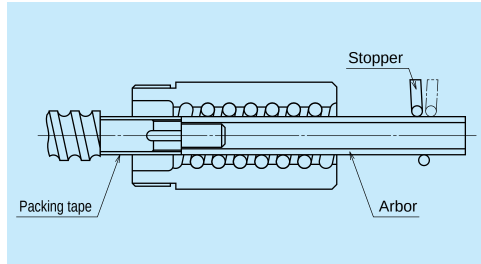

Fig. 14.3 Arbor and shaft end configuration

B-2-14.2 Inserting R Series Nut into Rolled Screw Shaft

When delivered, the nut of R series is separated from the screw shaft, and inserted into an arbor shaft. The nut must be inserted to the screw shaft when mounting ball screw.

(1) Consideration to end configuration of screw shaft

The balls may fall out during moving the assembled nut from the arbor to the screw shaft if the sizes and shapes of the arbor and the screw shaft are not appropriate.

If the end of the ball groove can touch the end of the arbor, connect both ends and move the assembled nut from the arbor to the screw shaft (Fig. 14.2).

If the end face of the arbor cannot connect to the end face of the screw because of configuration of both ends of screw shaft, wrap a tape outside of ball screw shaft so that the layers of tape is equal with the outside diameter of the arbor (Fig. 14.3).

If there is a key way or a nick along the way, fill such gaps prior to moving the ball nut.

(2) Installation of arbor

Confirm the correct nut orientation for installation. Remove the stop ring on the side from where the assembled nut is to be removed. Align the centers of the screw shaft and the arbor while pressing firmly the screw shaft end against the arbor.

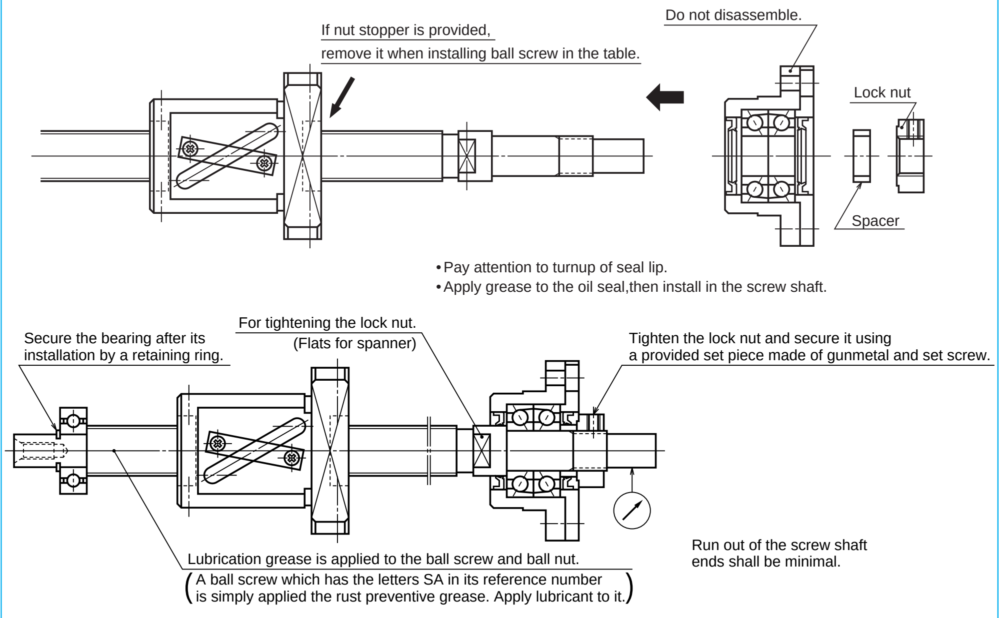
(3) Moving the nut

Slide the nut until it lightly touches the shoulder of the ball groove section, and stop it. Turn the ball nut to the direction so that it moves to the ball grooves, while pressing the arbor to the screw shaft. Do not separate the arbor from the screw shaft until the ball groove end appears completely in the ball nut.

B-2-14.3 Installation of Ball Screw and Support Unit

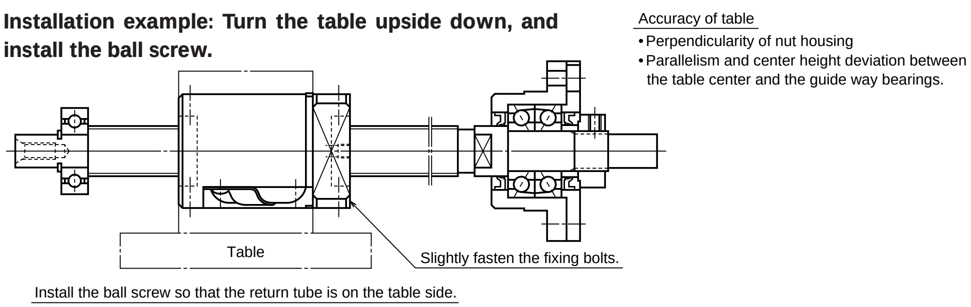
The illustrations below show typical installation procedures of a standard ball screw and a support unit.

(1) Assembly of support unit

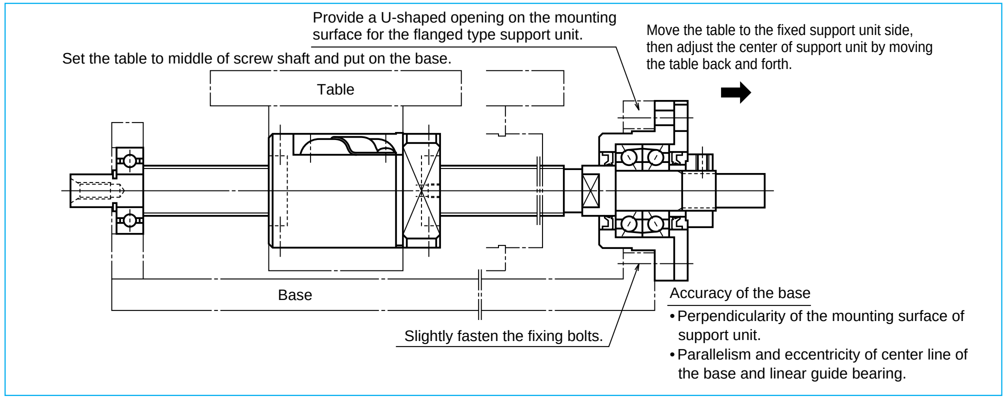


(2) Installation of ball nut to the table

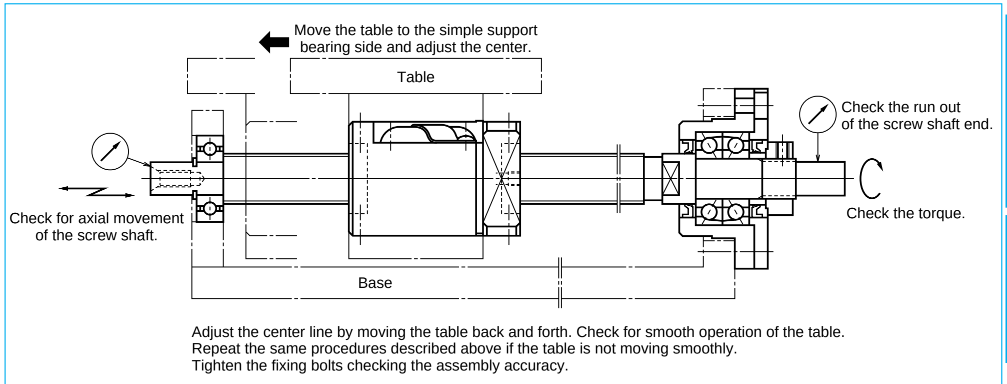
Installation example: Turn the table upside down, and install the ball screw.



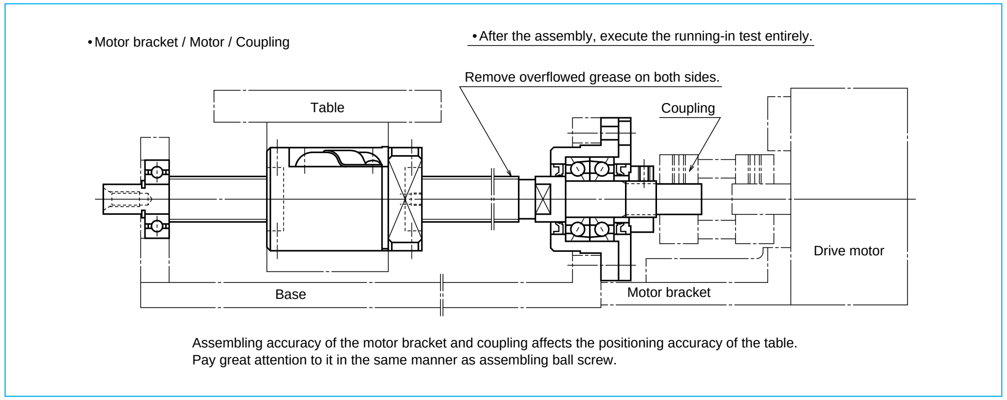
(3) Base and the support unit installation on the fixed support side



(4) Base and bearing installation on simple support side, and confirming assembling accuracy.



(5) Assembly completed.



B-2-14.4 Shaft End Machining

Shaft end is machined in the following three occasions.

* Precision ball screws with blank shaft end.
* Ball screws in R Series with blank shaft end.
* Additional machining of a completed ball screw

The following are summaries of machining of these shaft ends. For details, please contact NSK.

(1) Additional machining of precision ball screw with blank shaft

① Cutting screw shaft
Use a cutting whetstone, etc. to cut the shaft, leaving stock for turning. Keep the nut in the assembled state to the screw shaft, and open only one side of the plastic wrapping bag, expose only the shaft end section to be machined, then cut the screw shaft. This prevents foreign matters from entering to the ball screw section. Do the same for other machining.

② Precautions in cutting shaft end
Outside of the screw shaft is ground with precision. There is a center hole in the ends. Use them for centering. Do not rotate the shaft quickly or stop it suddenly, or the nut might move along the shaft. We recommend securing the nut with tape. To machine a very long shaft, apply work rests to the screw shaft surface to suppress vibration (especially caused by critical speed).

③ Turning by lathe
Cut to the length, turn shaft end steps, turn thread screw, and provide the center hole. Refer to JIS B1192 which sets standards for shaft end accuracy.

④ Processing by grinding
Apply the same precautions as for cutting for centering, securing nut, and work rest. Grind sections where the bearings and a "Spann ring" are installed.

⑤ Milling processing
Process key way and lockwasher tooth seat.

⑥ Deburring, washing, rust prevention
Wash with clean white kerosene after processing. Apply lubricant for immediate use. For later use, apply rust preventive agent.
[Note]
Contact NSK if nut is accidentally removed.

(2) Additional machining of R Series ball screw shaft end

① Cutting screw shaft
Carry out the same process as for Precision ball screw with blank shaft above.

② Annealing the shaft end (Heat the section of the shaft end to be machined with an acetylene torch. Then gradually cool it in ambient atmosphere.)
* The area not machined loses hardness if exposed to heat. This shortens ball screw life. Cool with water the areas where should not be heated to avoid heat conduction.

③ The following process is the same as Precision ball screw with blank shaft above.

B-2-15 Precautions for Designing Ball Screw

B-2-15.1 Safety System

As shown in the illustration on Page B80, a stopper is installed in some cases to prevent the nut from overrunning due to malfunction of the safety system of the machine itself, or human error during operation.
The travel stopper should be installed at a place where it will not come into contact with the nut when the nut reaches the designed stroke end.
An impact absorbing travel stopper (NSK patent, refer to Page B456) is available at NSK.

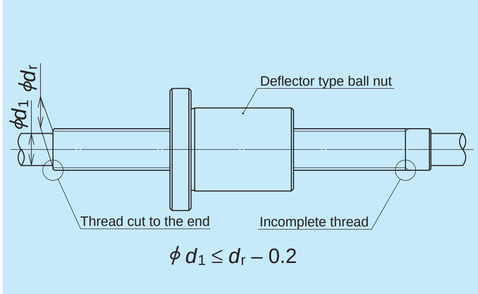


Fig. 15.1 Shaft end of a deflector recirculation system ball screw

B-2-15.2 Design Cautious to Assembling Ball Screw

(1) Cutting through the thread screw to the end

For the deflector, end cap and a part of end deflector ball recirculation system ball screws, one end of the thread screw should be cut through. This is for convenience of assembly for ball nut to the screw shaft (Fig. 15.1).
In this case, the shaft end diameter, where this thread cut through is made, should be 0.2 mm or smaller than the ball groove root diameter "d_r" (See the dimension table). A similar precaution is required when it is absolutely necessary to remove the nut from the screw shaft in order to install the ball screw to the machine. Also, in case using the cut-through end as the shoulder of the support bearing, make certain that a sufficient amount of the effective flat surface is left from the root diameter. If it is insufficient, the bearing cannot be installed in perpendicular to the bearing seat. (Fig. 15.2)

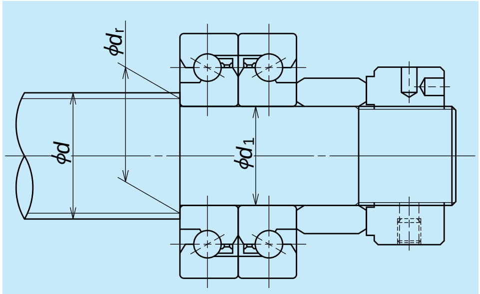

Fig. 15.2 Support bearing and end face (shoulder) for installation

(2) Designing screw shaft end and the nut area

When installing a ball screw to the machine, avoid a design which makes it necessary to separate the nut from the screw shaft as shown in Fig. 15.3. If separated, the balls may fall out. Separation may also deteriorate the ball screw accuracy, or may damage the ball screw. If separating them is unavoidable, please furnish NSK with the component which is to be installed between the nut and screw shaft. NSK will install the component prior to delivery.

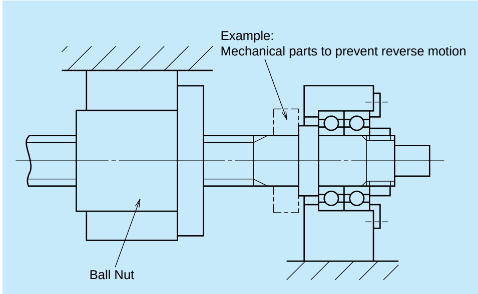

Fig. 15.3 Nut and ball screw are required to be separated when installing in this structure.

(3) Removing nut from the shaft at time of assembly

If it is unavoidable, use an arbor (Fig. 15.4), keeping the balls in the nut. In this case, the outside diameter of the arbor should be approximately 0.2 to 0.4 mm smaller than the ball groove root diameter "d_r."

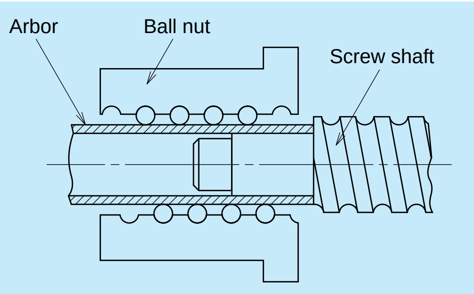

Fig. 15.4 Arbor to install and remove nut

(4) Centering of the ball nut when installing

When installing the nut as shown in Fig. 15.5, provide a space between the housing and the nut body diameter, allowing the centering to be performed.

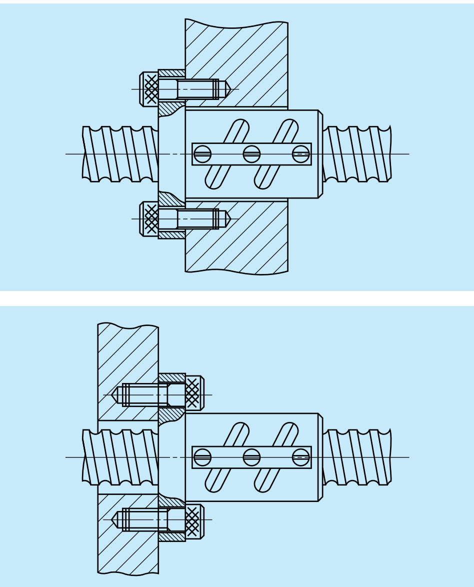

Fig. 15.5 Fixing a ball nut by flange

(5) Preventing the thread screw of nut from loosening

When installing and securing the nut to the housing at the thread screw section, as in the case for RNCT Series of R Series ball screw, apply an agent which prevents the nut from loosening.

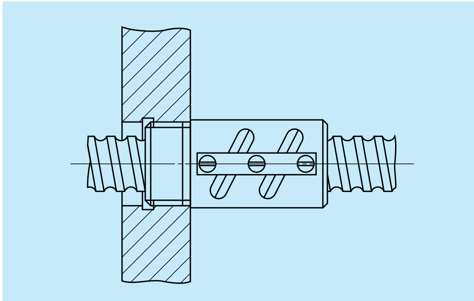

Fig. 15.6 Fixing a ball nut with thread screw

(6) Installation of brush-seal to the nut

If the brush-seal is installed at the thread screw side of the nut which comes with a thread screw, the brush-seal should be designed to be secured as shown in Fig. 15.7.

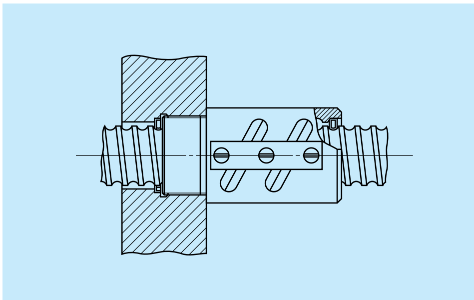

Fig. 15.7 Installation of brush-seal to a ball nut with thread screw

B-2-15.3 Effective Stroke of Ball Screw

Rigidity of a ball screw which is hardened by the induction hardening may be slightly low at both ends of the screw section. Consider this low hardness prior to determining the length of effective stroke. Please consult NSK for details.

B-2-15.4 Matching after Delivery

Please inform NSK on the position and size if it is necessary to machine the screw shaft end, or if a knock pin at the nut installation section is needed after delivery.
NSK takes a measure and protects designated spots from heat treatment prior to delivery to make subsequent machining easy.

B-2-15.5 NSK K1™ Lubrication Unit

When using NSK K1 lubrication unit, be aware of the operating temperature and chemicals that come to contact for keeping the best performance of K1.

Temperature range for use:

Maximum temperature for use; 50°C

Momentary maximum temperature in use; 80°C

Chemicals that should not come to contact:

Do not leave K1 Seal in organic solvent, white kerosene such as hexane, thinner which removes oil, and rust preventive oil which contains white kerosene.

Water-type cutting oil, oil-type cutting oil, grease such as mineral-type AS2 and ester-type PS2 do not damage K1 Seal.

B-2-16 Ball Screw Selection Exercise

[Drill 1] High-speed transporting system

1. Design conditions

Table mass :	$m_1 = 40$ kg
Mass of the transporting item :	$m_2 = 20$ kg
Maximum stroke :	$S_{max} = 700$ mm
Rapid traverse speed :	$V_{max} = 1000$ mm/sec (60 m/min)
Positioning accuracy :	±0.05/700 mm (0.005 mm/pulse)
Repeatability :	±0.005 mm
Required life :	$L_t = 25000$ h (5 years)
Guide way (rolling) :	μ = 0.01 (friction coefficient)
Drive motor :	AC servo motor ($N_{max} = 3000$ min^{-1})

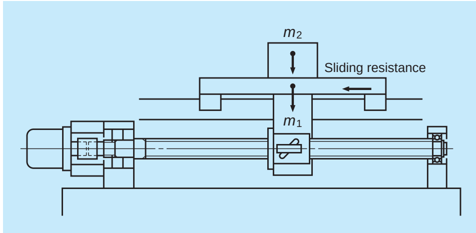

Fig. 16.1 System appearance

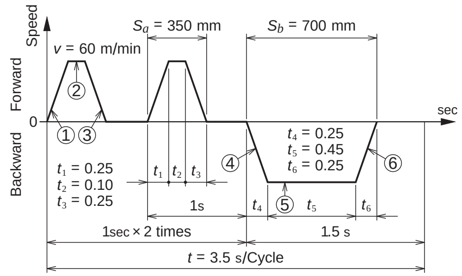

Fig. 16.2 Operating condition

2. Selection of basic factors

(1) Selection of accuracy grade and axial play

According to Table 4.1 Accuracy grades of ball screw and their application (B19), accuracy grade of industrial robots cartesian type and other purposes are C5 to Ct10.

From the following conditions in design, the axial play should be 0.005 mm or less.

Repeatability : ±0.005 (mm)

Resolution : 0.005 mm/pulse

According to Table 4.2 Combinations of accuracy grades and axial play (B20), you will require accuracy grade C5 if the axial play is below 0.005 mm. Therefore select accuracy grade C5, and axial play 0 mm (Z preload)

(2) Selection of lead

Calculate lead l based on AC servo motor maximum speed and rapid traverse speed V_{max}.

$$l \geq \frac{V_{max}}{N_{max}} = \frac{1000 \times 60}{3000} = 20 \text{ (mm)}$$

Select a lead l of 20 mm or larger.

(3) Selection of screw shaft diameter

According to "Table 4.6 Shaft diameter, lead and stroke of standard ball screw" on Page B23, the screw shaft diameter d which has a lead l larger than 20 mm should be in the range of 15 mm to 32 mm. Select the smallest 15 mm.

(4) Selection of stroke

From "Table 4.6 Screw shaft diameter, lead, and stroke of standard ball screw" on page B23, ball screw with shaft diameter d = 15 mm and lead l = 20 mm meets maximum stroke 700 mm, therefore it is possible to select from standard ball screw. Primary selection is as follows:

Primary selection:

Shaft diameter :	15 (mm)
Lead :	20 (mm)
Stroke :	700 (mm)
Accuracy grade :	C5
Axial play :	Z

3. Confirmation of standard ball screw

In consideration of delivery time and price, select from the standard ball screw finished shaft end.

Primary candidate: W1507FA-3PG-C5Z20

4. Checking basic safety

Calculate for the primary candidate.

(1) Allowable axial load

① Calculation of allowable axial load

From Fig. 16.2: Acceleration α_1 at accelerating / decelerating is:

$$\alpha_1 = \frac{V_{max}}{t_1} = \frac{1000}{0.25} = 4000 \text{ (mm/s}^2\text{)} = 4 \text{ (m/s}^2\text{)}$$

Axial load F_i is:

(At time of acceleration ①④)

$$F_1 = \mu (m_1 + m_2) \times g + (m_1 + m_2) \times \alpha_1$$
$$= 0.01 \times (40 + 20) \times 9.80665 + (40 + 20) \times 4$$
$$= 246 \text{ (N)}$$

(At time of constant speed ②⑤)

$$F_2 = \mu (m_1 + m_2) \times g = 0.01 \times (40 + 20) \times 9.80665$$
$$= 6 \text{ (N)}$$

(At time of deceleration ③⑥)

$$F_3 = -\mu (m_1 + m_2) \times g + (m_1 + m_2) \times \alpha_1$$
$$= -0.01 \times (40 + 20) \times 9.80665 + (40 + 20) \times 4$$
$$= 234 \text{ (N)}$$

Thus, the maximum axial load P is 246 N.

② Buckling load

W1507FA-3PG-C5Z20 has distance La = 804 mm (per specifications on Page B277), table maximum axial load P = 246 (N). Supporting condition of screw shaft is Fixed - Simple support, and supporting condition of ball nut is Fixed. Due to the direction of the load, supporting condition is Fixed – Fixed support (Factor m = 19.9).

From Fomula (Ⅱ-2) on Page B48:

$$d_r \geq \left(\frac{P \cdot L_a^2}{m} \times 10^{-4}\right)^{1/4} = \left(\frac{246 \times 804^2}{19.9} \times 10^{-4}\right)^{1/4}$$
$$= 5.3 \text{ (mm)}$$

W1507FA-3PG-C5Z20 has dimension dr = 12.2 mm per dimension chart (Page B277) and therefore meets the condition.

Result: Acceptable

(2) Checking allowable value of rotational speed

The permissible rotational speed listed in the dimension table is 3000 min^{-1}. Since the motor maximum rotational speed is 3000 min^{-1}, the operation is in the range of permissible rotational speed.

Result: Acceptable

(3) Checking life expectation

① Mean load F_m, mean rotational speed N_m

From calculation of axial load. Rotational speed N_i and operating time t_i is:

(At time of acceleration ①④)

$$F_1 = 246 \text{ (N)}$$
$$N_1 = \frac{n}{2} = \frac{3000}{2} = 1500 \text{ (min}^{-1}\text{)}$$
$$t_a = 2 \times t_1 + t_4 = 0.75 \text{ (s)}$$

(At time of constant speed ②⑤)

$$F_2 = 6 \text{ (N)}$$
$$N_2 = 3000 \text{ (min}^{-1}\text{)}$$
$$t_b = 2 \times t_2 + t_5 = 0.65 \text{ (s)}$$

(At time of deceleration ③⑥)

$$F_3 = 234 \text{ (N)}$$
$$N_3 = 1500 \text{ (min}^{-1}\text{)}$$
$$t_c = 2 \times t_3 + t_6 = 0.75 \text{ (s)}$$

Calculation result is shown in Table 16.1

Table 16.1 Axial load and rotational speed

Operating condition	Axial load (N)	Rotational speed (mean) (min^{-1})	Operating time (s)
① ④	$F_1 = 246$	$N_1 = 1500$	$t_a = 0.75$
② ⑤	$F_2 = 6$	$N_2 = 3000$	$t_b = 0.65$
③ ⑥	$F_3 = 234$	$N_3 = 1500$	$t_c = 0.75$

From Formulas (Ⅱ-11) and (Ⅱ-12) on Page B57:

$$F_m = \left(\frac{F_1^3 \cdot N_1 \cdot t_a + F_2^3 \cdot N_2 \cdot t_b + F_3^3 \cdot N_3 \cdot t_c}{N_1 \cdot t_a + N_2 \cdot t_b + N_3 \cdot t_c}\right)^{1/3}$$
$$= 195 \text{ (N)}$$

$$N_m = \frac{N_1 \cdot t_a + N_2 \cdot t_b + N_3 \cdot t_c}{t}$$
$$= 1200 \text{ (min}^{-1}\text{)}$$

② Calculation of life expectation

W1507FA-3PG-C5Z20 (Clearance Z) is C_a=3870N (From dimension table on Page B277), from Formulas (Ⅱ-8) and (Ⅱ-9) on Page B57:

$$L_t = \left(\frac{C_a}{F_m \cdot f_w}\right)^3 \times \frac{1}{60N_m} \times 10^6$$

$$= \left(\frac{3870}{195 \times 1.2}\right)^3 \times \frac{1}{60 \times 1200} \times 10^6$$

$$\fallingdotseq 62800$$

This grade satisfies the required life.

Result: Acceptable

5. Check whether the following figures meet requirements

(1) Accuracy and axial play

From the dimension table and the permissible value of lead accuracy on Page B42:

According to Table 1.2:

Accuracy grade: C5

$e_p = \pm0.035/800$ (mm)

$\upsilon_u = 0.025$ (mm)

This grade satisfies the required positioning accuracy ±0.05/700 mm.

Checking axial play is omitted here since it is explained in "2. Selection of basic factors."

(2) Drive torque

Required specifications are as follows.

Motor rotational speed : 3000 min^{-1}

Time to reach maximum speed : Under 0.25 sec

① Load (converted to motor axis)

Using Formula (Ⅱ-32) and (Ⅱ-33) on Page B68, calculate the moment of inertia whereas γ is density.

(Screw shaft)

$$J_B = \frac{\pi \cdot \gamma}{32} D^4 \cdot L = \frac{\pi \times 7.8 \times 10^{-3}}{32} \times 1.5^4 \times 80$$

$$= 0.31 \text{ (kg} \cdot \text{cm}^2\text{)}$$

(Moving part)

$$J_w = m \times \left(\frac{l}{2\pi}\right)^2 = 60 \times \left(\frac{2}{2\pi}\right)^2$$

$$= 6.1 \text{ (kg} \cdot \text{cm}^2\text{)}$$

(Coupling)

$J_c = 0.25$ (kg · cm^2)···Temporary

(As a whole)

Moment of inertia of the ball screw J_L is:

$$J_L = J_B + J_W + J_C$$

$$= 0.31 + 6.1 + 0.25$$

$$= 6.7 \times 10^{-4} \text{ (kg} \cdot \text{m}^2\text{)}$$

② Driving torque

Assuming that WBK12-01 compact light load type will be used, as recommended for W1507FA-3PG-C5Z20, and moment of inertia of motor $J_M = 3.1$ (kg · cm^2) = 3.1×10^{-4} (kg · m^2).

(At time of constant speed)

Torque which is necessary to drive a ball screw at constant speed resisting to external loads is per Formula (Ⅱ-30) on Page B68

$$T_1 = T_a + T_{pmax} + T_u$$

in this Formula, T_a is drive torque at constant speed, T_{pmax} is upper limit of the dynamic friction torque of ball screw, T_u is friction torque of the support bearing.

From dimension chart on Page B227 T_{pmax} = 7.8 (N · cm) and from Page B444 T_u = 2.1 (N · cm)

$$T_a = \frac{F_a \cdot l}{2\pi\eta_1}$$

Using Formula (Ⅱ-28) on Page B67, Drive torque at constant speed T_1 is:

$$T_1 = \frac{F_a \cdot l}{2\pi \cdot \eta_1} + T_{pmax} + T_u$$

$$= \frac{6 \times 2}{2\pi \times 0.9} + 7.8 + 2.1$$

$$= 12 \text{ (N} \cdot \text{cm)} = 0.12 \text{ (N} \cdot \text{m)}$$

(At time of acceleration)

Drive torque necessary for accelerating the ball screw resisting axial load can be calculated by Formula (Ⅱ-31) on Page 68

$$T_2 = T_1 + J \cdot \frac{2\pi \cdot n}{60t_1}$$

$$= T_1 + (J_L + J_M) \cdot \frac{2\pi \cdot n}{60t_1}$$

$$= 0.12 + (6.7 \times 10^{-4} + 3.1 \times 10^{-4}) \frac{2\pi \times 3000}{60 \times 0.25}$$

$$= 1.35 \text{ (N} \cdot \text{m)}$$

(At time of deceleration)

Similarly at time of acceleration.

$$T_3 = T_1 - J \cdot \frac{2\pi \cdot n}{60t_3}$$

$$= T_1 - (J_L + J_M) \cdot \frac{2\pi \cdot n}{60t_3}$$

$$= 0.12 - (6.7 \times 10^{-4} + 3.1 \times 10^{-4}) \frac{2\pi \times 3000}{60 \times 0.25}$$

$$= -1.11 \text{ (N} \cdot \text{m)}$$

③ Selection of motor

Selection conditions are as follows.

Maximum rotational speed: $N_M \geq 3000$ (min^{-1})

Motor rating torque: $T_M \geq T_{rms}$ (N · m)

(T_{rms}: Effective torque)

Motor's rotor inertia -- $J_M > J_L/3$ or more

Form above: select an AC servo motor with the following specifications.

Motor specifications:	
Rating power output:	$W_M = 300$ (W)
Maximum rotational speed:	
	$N_M = 3000$ (min^{-1})
Rating torque:	$T_M = 1$ (N · m) $= 1 \times 10^2$ (N · cm)
Rotor inertia:	$J_M = 3.1 \times 10^{-4}$ (kg · m^2)
	$= 3.1$ (kg · cm^2)

④ Checking effective torque

Effective torque T_{rms} can be calculated as follows:

$$T_{rms} = \sqrt{\frac{T_2^2 \times t_a + T_1^2 \times t_b + T_3^2 \times t_c}{t}}$$

$$= \sqrt{\frac{1.35^2 \times 0.75 + 0.12^2 \times 0.55 + 1.11^2 \times 0.75}{3.5}}$$

$$= 0.81$$

and meets $T_M \geq _{rms}$.

⑤ Checking time to reach maximum speed

Time required to reach rapid traverse speed can be calculated as follows whereas $T_M' = 2 \times T_M$

$$t_a = \frac{(J_L + J_M) \times 2\pi \times n}{(T_M' - T_1)} \times 1.4$$

$$= \frac{(6.7 \times 10^{-4} + 3.1 \times 10^{-4}) \times 2\pi \times 3000}{(2 \times 1 - 0.12) \times 60} \times 1.4$$

$$= 0.23$$

and meets requirement 0.25 sec or less.

From above: Use W1507FA-3PG-C5Z20

Operation	Axial load (N) Cutting resistance	Axial load (N) Sliding resistance	Feed speed (mm/min)	Use time ratio (%)
Rapid traverse	0	2354	15000	30
Light/medium cutting	4000	2354	500	50
Heavy cutting	8000	2354	100	20

∗ Sliding resistance: $F_r = \mu\,(m_1 + m_2)\,g = 0.15 \times (1000 + 600) \times 9.80665 = 2354$ (N)
∗ Ignore inertia at time of acceleration/deceleration because their time ratios are small.

2. Selection of basic factors

(1) Selection of accuracy grade and axial play

Accuracy grade should be in the range from C1 to C5 according to "Table 4.1 Precision grades of ball screw and their applications" on Page B19.
Assuming nut length 200 mm and extra stroke 100 mm, shaft length L_0 is assumed as follows:

L_0 = Maximum stroke + nut length + margin
= 1000 = (200) + (100) = 1300

From "Table 1.2 Tolerance on specified travel and travel variation of the positioning ball screws" on Page B42, the accuracy that satisfies required function is possibly:

Accuracy C3 grade
$e_p = \pm 0.029/1600$ (mm)
$\upsilon_u = 0.018$ (mm)

Considering importance on the volume of lost motion, select Z code (axial play 0 mm and less) for axial play.

(2) Selection of lead

From the maximum rotational speed of AC servo motor N_{max} and rapid traverse speed of table V_{max} , lead l is :

$$l \geq \frac{V_{max}}{N_{max}} = \frac{15000}{2000} = 7.5 \text{ (mm)}$$

Larger lead l would be beneficial for feed speed. But from the view of the control system (resolution), limit the lead l to 8 mm or 10 mm.

(3) Selection of screw shaft diameter

According to "Table 4.6 shaft diameter, lead and stroke of standard ball screw" on Page B23, shafts whose lead l is 8 mm or 10 mm are in the range of 10 mm to 50 mm. Placing more importance on rigidity than to the volume of lost motion, select a relatively large size in the range of 32 mm to 50 mm.

(4) Selection of stroke

Select 1000 mm, the maximum stroke in request.

Primary selection:
Standard ball screw
Shaft diameter: 32, 36, 40, 45, 50 mm
Lead: 8, 10 mm
Stroke: 1000 mm
grade: C3
Axial play code: Z

3. Confirmation of standard ball screw

Giving consideration to delivery time and price, select from the standard series.
C3 grade chosen in the Primary selection was not found in the standard ball screw. Let us check whether there is a C3 grade among ball screw.

4. Confirmation of made-to-order ball screw

Because standard ball screw does not meet accuracy grade requirement, we will consider made-to-order ball screw which is based on standard ball screw but with accuracy grade C3.

Second selection:
Made-to-order ball screw
Shaft diameter : 32, 36, 40, 45, 50 mm
Lead : 8, 10 mm
Stroke : 1000 mm
Accuracy grade : C3
Axial play : Z

5. Selection of screw shaft diameter, lead, and nut

(1) Dynamic load rating

Obtain required load carrying capacity of each lead through load conditions. From table 16.2 operating conditions on Page B91, calculate the rotation speed N_i as shown in Table 16.3.

$$N_i \geq \frac{V_i}{l}$$

Table 16.3 Load conditions

Operating condition	Axial load (N)	Rotations per minute (min^{-1}) l = 8	Rotations per minute (min^{-1}) l = 10	Use time ratio (%)
Rapid traverse	F_1 = 2354	N_1 = 1875	N_1 = 1500	t_1 = 30
Light/medium cutting	F_2 = 6354	N_2 = 62.5	N_2 = 50	t_2 = 50
Heavy cutting	F_3 = 10354	N_3 = 12.5	N_3 = 10	t_3 = 20

By using Formula (Ⅱ-11) and (Ⅱ-12) on Page B57, calculate mean load F_m and mean rotational speed N_m as shown below.

$$F_m = \left(\frac{F_1^3 \bullet N_1 \bullet t_1 + F_2^3 \bullet N_2 \bullet t_2 + F_3^3 \bullet N_3 \bullet t_3}{N_1 \bullet t_1 + N_2 \bullet t_2 + N_3 \bullet t_3} \right)^{1/3}$$

$$N_m = \frac{N_1 \bullet t_a + N_2 \bullet t_b + N_3 \bullet t_c}{t}$$

Table 16.4 Mean load and mean rotational speed

Lead (mm)	8	10
Mean load F_m (N)	3122	3122
Mean rotational speed N_m (min^{-1})	596	477

B
92

Required dynamic load rating C_a is:

From Formulas (Ⅱ-8) and (Ⅱ-9) on Page B57:

$$C_a \geq (60N_m \bullet L_t)^{1/3} \bullet F_m \bullet f_w \times 10^{-2} \ (N)$$

Whereas required life expectancy L_t = 20000 (h), load coefficient f_w = 1.2 (refer to Page B57),

l = 8 (mm)············$C_a \geq$ 33500 (N)

l = 10 (mm)··········$C_a \geq$ 31100 (N)

(2) Selection of the nut

Due to lost motion requirements rigidity will be important, so the nut will be selected as follows. Table 16.5 shows the dynamic load rating of each specification.

- Standard nut ball screw, tube type
- Model: ZFT, DFT (Pages B475 to B504)
- Number of turns of balls : Select from 2.5 turns 2 circuits or 2.5 turns 3 circuits

From Table 16.5 select item that meets required dynamic load rating C_a as follows:

Third selection: In the range surrounded by the dotted lines ▭ in Table 16.5

Table 16.5 Dynamic load rating of each specification

Screw shaft diameter (mm)	Dynamic load rating Ca: (N) Lead 8 mm 2.5 turns 2 circuits	Lead 8 mm 2.5 turns 3 circuits	Lead 10 mm 2.5 turns 2 circuits	Lead 10 mm 2.5 turns 3 circuits
32	31700	–	46300	–
36	–	–	49300	–
40	34900	–	52000	–
45	–	–	54200	76800
50	38700	54900	57700	81800

(3) Permissible rotational speed

① Critical speed

Calculate based on rapid traverse speed V_{max} = 15000 mm/min. Ball screw rotational speed at each lead N is:

l = 8 (mm)·······N = 1875 (min^{-1})

l = 10 (mm)·····N = 1500 (min^{-1})

Based on Formula (Ⅱ-7) on Page B51, screw shaft root diameter to meet critical speed requirement is:

$$d_r \geq \frac{n \bullet L_2^{\ 2}}{f} \times 10^{-7} \ (\text{mm})$$

In this formula, unsupported length L_a is:

L_a = Maximum stroke + nut length/2 + shaft end extra length

= 1000 + 100 + 200 = 1300 (mm)

Supporting condition of screw shaft is Fixed - Fixed support, and supporting condition of ball nut is Fixed. Therefore, supporting condition is Fixed - Fixed support (Factor f = 21.9)

l = 8 (mm)······$d_r \geq$ 14.5 (mm)

l = 10 (mm)····$d_r \geq$ 11.6 (mm)

② $d \bullet n$ value

From Table 3.2 on Page B54, as the d·n is 70000 or less, screw shaft diameter to meet the d·n value is:

$$d \leq \frac{70000}{N} \ (\text{mm})$$

l = 8 (mm)············$d \leq$ 37.3 (mm)

l = 10 (mm)··········$d \leq$ 46.7 (mm)

Based on nut specifications (Page B475-504) select item that meets screw shaft root diameter and screw shaft diameter.

＊Please consult NSK if it is necessary to use at d • n > 70000.

Fourth selection: In the range surrounded by the solid-lines in Table 16.5

(4) Rigidity of the ball screw system

Set the lost motion of the ball screw system (screw shaft, nut and support bearing) at 80% of the specified value. Then calculate the system rigidity. The lost motion is:

20 (µm) × 0.8 = 16 (µm)

At this time, the single-direction elastic deformation $\varDelta L$ of the major factors of ball screw system becomes half.

$\varDelta L \leq$ 8 (µm)

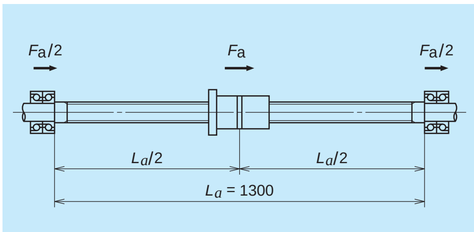

Fig. 16.3 Unsupported length

① Rigidity of the screw shaft K_S

Calculate at the screw shaft center where axial deformation becomes the largest. Because supporting condition of screw shaft is Fixed - Fixed support, from Formula (Ⅱ-21) on Page B62:

$$K_s = \frac{\pi \bullet d_r^{\ 2} \bullet E}{L_a} \times 10^{-3} \ (\text{N/mm})$$

Whereas E is Elastic Modules. From Formula (Ⅱ-17) on page B61, elastic deformation of the screw shaft $\varDelta L_S$ is

$$\varDelta L_s = \frac{F_a}{K_s} = \frac{F_a \bullet L_a}{\pi \bullet d_r^{\ 2} \bullet E} \times 10^3 \ (\mu\text{m})$$

F_a: Sliding resistance

$F_a = \mu \ (m_1 + m_2) = 0.15 \times (1000 + 600)$

= 2354 (N)

Table 16.7 shows the rigidity of screw shaft K_S and the elastic deformation $\varDelta L_S$.

② Rigidity of the nut K_N

Set about 1/3 of the maximum axial load as the preload value.

$$F_{a0} = \frac{F_{max}}{3} = \frac{10354}{3} = 3452 \rightarrow 3500 \ (\text{N})$$

From Formula (Ⅱ-23) on Page B64:

Rigidity:

$$K_N = 0.8 \times K \left(\frac{F_{a0}}{\varepsilon \bullet C_a}\right)^{1/3} = 0.8 \times K \left(\frac{3500}{0.1 \bullet C_a}\right)^{1/3} \ (\text{N/µm})$$

K : Theoretical rigidity

From Formula (Ⅱ-17) on page B62, elastic deformation of the ball nut $\varDelta L_N$ is

$$\varDelta L_N = \frac{F_a}{K_N} = \frac{2354}{K_N}$$

Table 16.7 shows the rigidity of nut K_N and the elastic deformation $\varDelta L_N$.

③ Rigidity of the support bearing K_B

The bearing is thrust angular contact ball bearing for ball screw support (TAC Series). Assume each shaft diameter is as shown in Table 16.6 (Refer to Page B457).

Table 16.6 Bearing code

Screw shaft diameter (mm)	Bearing code
32	25TAC62BDF
36	25TAC62BDF
40	30TAC62BDF
45	35TAC72BDF

Refer to Page B461 for rigidity K_B of each bearing (axial spring modulus). Elastic deformation of bearing $\varDelta L_B$ is:

$$\varDelta L_B = \frac{F_a}{2K_B}$$

Table 16.7 shows the rigidity of support bearing K_B and the elastic deformation $\varDelta L_B$.

Table 16.7 Rigidity and elestic deformation

Nut model number	Screw shaft K_S	Screw shaft $\varDelta L_S$	Nut K_N	Nut $\varDelta L_N$	Support bearing K_B	Support bearing $\varDelta L_B$	Total $\varDelta L$
DFT3210-5	347	6.8	839	2.8	1000	1.2	10.8
DFT3610-5	460	5.1	907	2.6			8.9

DFT4510-5	772	3.0	1050	2.2	1180	1.0	6.2
DFT4510-7.5			1375	1.7			5.7

Choose the most economical ball screw which meets single direction deformation requirement $\varDelta L$ is 8 µm or less.

The selected ball screw:

Nut model code : DFT4010-5

Shaft diameter : 40 (mm)

Lead : 10 (mm)

Dynamic load rating : 52000 (N)

6. Decision of screw shaft length

Nut reference number DFT4010 has nut length 193 mm and unsupported length L_a is:

L_a = Maximum stroke + nut length + margin

= 1000 + 193 + 100 = 1293 → 1300 mm

7. Checking basic safety

(1) Permissible axial load

Calculate buckling load for conditions shown in Fig. 16.4 with P = 10354 (N) and L_1 = 1210 (mm)

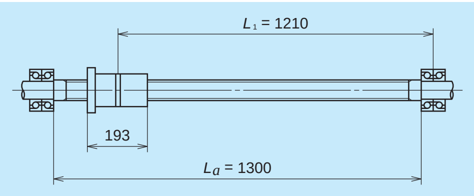

Fig. 16.4 Examination of bucking load

Supporting condition is Fixed - Fixed support, from buckling load calculation Formula (Ⅱ-2) on Page B48, screw shaft diameter d_r to prevent buckling

$$d_r \geq \left(\frac{P \bullet L_1^2}{m} \times 10^{-4} \right)^{1/4}$$

$$= \left(\frac{10354 \times 1210^2}{19.9} \times 10^{-4} \right)^{1/4} = 16.6 \text{ (mm)}$$

From DFT4010-5 specifications (page B493) shaft root diameter is d_r = 34.4 and meets requirement.

Result: Acceptable

(2) Permissible rotational speed

① Critical speed n

From critical speed calculation Formula (Ⅱ-7) on Page B51,

$$n = f \bullet \frac{d_r}{L_1^2} \times 10^7 = 21.9 \times \frac{34.4}{1210^2} \times 10^7$$

$$\fallingdotseq 5140$$

Maximum rotational speed N_{max} = 1500 min^{-1} is smaller than critical speed and meets requirement.

Result: Acceptable

② $d \bullet n$ value

$d \bullet n$ value is:

$$d \bullet n = 40 \times 1500 = 60000$$

From Table 3.2 on Page B54, d·n of tube type is 70000 or less and meets requirement.

Result: Acceptable

(3) Life L_t

Dynamic load rating C_a = 52000 N (See dimension table on page B491), and from Formulas (Ⅱ-8) and (Ⅱ-9) on Page B57,

$$L_t = \left(\frac{C_a}{f_w \bullet F_m} \right)^3 \times 10^6 \times \frac{1}{60 \bullet N_m}$$

$$\fallingdotseq 95000$$

and meets required life 20000 (h).

Result: Acceptable

8. Check whether the following factors satisfy requirements

(1) Checking accuracy

① Positioning accuracy

Positioning accuracy ±0.035/1000 mm, and therefore from "Table 1.2 Tolerance of specified travel and travel variation" on Page B42:

Accuracy grade : C3
e_p = ±0.029/1600 (mm)
υ_u = 0.018 (mm)

and meets required positioning accuracy.

② Measures against thermal expansion

Provide pre-tension force equivalent to the elongation of 3°C temperature rise, taking in consideration of the load carrying capacity of bearing. Also, adjust the travel compensation for the specified travel by a volume equivalent to 3°C temperature rise. (Refer to Page B44)

(a) Thermal elongation : ΔL_θ

From Formula (Ⅱ-1) on Page B44:

$$\Delta L_\theta = \rho \bullet \theta \bullet L_a = 12.0 \times 10^{-6} \times 3 \times 1300$$

$$= 0.047 \text{ (mm)}$$

(b) Pre-tension force : F_θ

$$F_\theta = \Delta L_\theta \bullet Ks = \frac{\Delta L_\theta \bullet E \bullet \pi \bullet d_r^2}{4L_a}$$

$$= \frac{0.047 \times 2.06 \times 10^5 \times \pi \times 34.4^2}{4L \times 1300}$$

$$\fallingdotseq 6922 \rightarrow 6900 \text{ (N)}$$

Travel compensation :	–0.047/1300 (mm)
Pre-tension force :	6900 (N)
Tension (elongation) volume :	0.047 (mm)

③ Selection of support bearing

Assuming that the ratio of basic dynamic load rating of support bearing (C_a) and pre-tension force (F_θ) is ε, select a bearing which generally satisfies:

$$\varepsilon = F_\theta / C_B < 0.20$$

Design the bearing supporting configuration to which pre-tension force is applied in such way that the axial load is received by the duplex combination or more. Please consult to NSK when one bearing must sustain the pre-tension load.

Table 16.8 Comparison of dynamic load rating and pre-tension force

(2) Checking drive torque of motor

Selection of driving motor

〈Required specifications〉

Motor rotational speed : 1500 min^{-1}

Time to reach maximum speed : Under 0.16 sec

(At time of rapid traverse)

① Load (converted to the motor load)

Calculate the moment of inertia of ball screw.

From Formulas (Ⅱ-32) and (Ⅱ-33) of Page B68, moment of inertia of ball screw parts J are calculated as follows, whereas γ is material density and ball screw shaft length L_o = 1550 mm

(Screw shaft)

$$J_B = \frac{\pi \bullet \gamma}{32} D^4 \bullet L_o = \frac{\pi \times 7.8 \times 10^{-3}}{32} \times 4^4 \times 155$$

$$= 30 \text{ (kg} \cdot \text{cm}^2\text{)}$$

(Moving part)

$$J_w = m \times \left(\frac{l}{2\pi} \right)^2 = 1600 \times \left(\frac{1}{2\pi} \right)^2$$

$$= 40 \text{ (kg} \cdot \text{cm}^2\text{)}$$

(Coupling)

$$J_c = 10 \text{ (kg} \cdot \text{cm}^2\text{)} \cdots \text{assumed}$$

(Total)

$$J_L = J_B + J_w + J_c = 30 + 40 + 10$$

$$= 80 \text{ (kg} \cdot \text{cm}^2\text{)} \rightarrow 80 \times 10^{-4} \text{ (kg} \cdot \text{m}^2\text{)}$$

② Driving torque

Necessary torque to drive a ball screw resisting to external loads T_1 can be obtained by Formula (Ⅱ-29) on Page 66:

$$T_1 = T_A + T_P + T_U$$

In this formula, T_A is drive torque at constant speed, T_P is dynamic friction torque, and, T_U is friction torque of the support bearing. From Formula (Ⅱ-26) on page B66 and Formula (Ⅱ-27) on B67, T_A and T_P are:

$$T_A = \frac{Fa \bullet l}{2\pi \eta_1}$$

$$T_P = 0.014 F_{a0} \sqrt{d_m \bullet l}$$

$$\eta_1 = 0.9$$

Refer to the starting torque value in Table 2.7 on Page B461:

T_U is:

$$T_U = 33 + 33 = 66 \text{ (N} \cdot \text{cm)}$$

So, the required drive torque during rapid traverse and heavy cutting T_{11} and T_{13} are:

(At time of rapid traverse)

$$T_{11} = T_{A1} + T_{P1} + T_{U1}$$

$$= \frac{2354 \times 1}{2\pi \times 0.9} + 0.014 \times 3500 \sqrt{4.1 \times 1} + 66$$

$$= 580 \text{ (N} \cdot \text{cm)} \rightarrow 580 \times 10^{-2} \text{ (N} \cdot \text{m)}$$

(At time of heavy cutting)

$$T_{12} = T_{A2} + T_{P2} + T_{U2}$$

$$= \frac{10354 \times 1}{2\pi \times 0.9} + 0.014 \times 3500 \sqrt{4.1 \times 1} + 66$$

$$= 1995 \text{ (N} \cdot \text{cm)} \rightarrow 1995 \times 10^{-2} \text{ (N} \cdot \text{m)}$$

③ Selection of the motor

〈Selection conditions〉

Maximum rotational speed : $N_M \geq 1500$ (min^{-1})

Motor rating torque : $T_M > T_1$ (N · m)

Motor's rotor inertia : $J_M > J_L / 3$ (kg · m^2)

Based on this, select AC servo motor as below.

Motor specifications

Rating power output: W_M = 1.8 (kW)

Maximum rotational speed:

N_M = 1500 (min^{-1})

Rating torque: T_M = 22.5 (N · m)

= 22.5 × 10^2 (N · cm)

Rotor inertia: J_M = 190 × 10^{-4} (kg · m^2)

= 190 (kg · cm^2)

④ Checking time to reach maximum speed:
Required time to reach rapid traverse speed can be calculated as follows, whereas $T_M' = 2 \times T_M$

$$t_a = \frac{(J_L + J_M) \times 2\pi \times N}{(T_M' - T_1) \times 60} \times 1.4$$

$$= \frac{(80 \times 10^{-4} + 190 \times 10^{-4}) \times 2\pi \times 1500}{(2 \times 22.5 - 580 \times 10^{-2}) \times 60} \times 1.4$$

$$= 0.15 \text{ (sec)}$$

and meets requirement 0.16 sec or less.

1. Design conditions

Mass of the traveling item :	m = 300 kg
Maximum travel :	S_{max} = 1500 mm
Rapid traverse speed :	V_{max} = 10000 mm/min
Repeatability :	0.3 mm
Required life :	L_t = 24000 h (16 hours × 300 days × 5 years)
Screw shaft supporting condition :	Fixed -- Simple support
Nut:	Flanged single nut
Guide way (rolling) :	μ = 0.01 (friction coefficient)
Drive motor :	AC servo motor (N_{max} = 1000 min^{-1})
Environment :	Slightly dusty

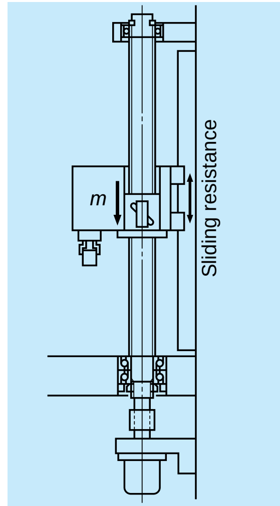

Fig. 16.5 System appearance

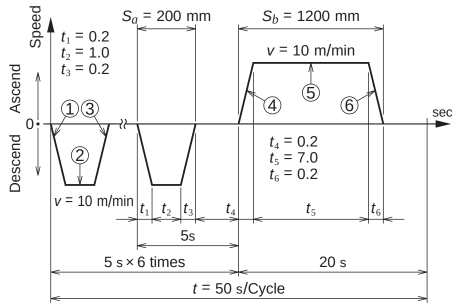

Fig. 16.6 Operating condition

2. Selection of basic factors

(1) Selection of accuracy grade

Although this application is not listed in Table 4.1 Accuracy grades of ball screw and their application on page B19, possibility is to use ball screw for transfer equipment R series, because the required repeatability is 0.3 mm that is not very high.

(2) Selection of lead

From the maximum rotational speed of AC motor:

$$l \geq \frac{V_{max}}{N_{max}} = \frac{10000}{1000} = 10 \text{ (mm)}$$

Select a lead 10 mm or over.

(3) Selection of screw shaft diameter

According to "Table 4.5 Shaft diameter, lead and standard screw length of R Series" on Page B22, the shaft diameters whose lead is 10 mm or over are in the range of 12 mm to 50 mm.

(4) Selection of stroke

From Table 4.5 Screw shaft diameter, lead and standard screw shaft length of R series on page B22, it is possible to select from R series because diameter d = 15 to 50 mm and lead l = 10 mm will meet the required maximum stroke 1500 mm.

Primary selection : R Series ball screw for transfer equipment

Screw shaft diameter :	15 – 50(mm)
Lead :	10(mm)
Stroke :	1500(mm)

3. Confirmation of standard ball screw

Select from Flanged single nuts of R Series ball screw for transfer equipment.

Second selection : R Series ball screw for transfer equipment

Screw shaft diameter :	16, 20, 25, 32, 36 40, 45, 50 (mm)
Lead :	10 (mm)
Stroke :	1500 (mm)

4. Decision of screw length

Screw length L_o is:

L_o = Stroke + nut length + margin + shaft end length

= 1500 + 100 + 100 + 200 = 1900 (mm)

Normally, $L_o/d \leq 70$ is recommended.

Therefore, screw shaft diameter d is:

$$d \geq \frac{L_s}{70} = \frac{1900}{70} = 27.1\ (\text{mm})$$

Third selection : R Series ball screw for transfer equipment

Shaft diameter:	32, 36, 40, 45, 50 (mm)
Lead:	10 (mm)
Stroke:	1500 (mm)

5. Checking basic safety

(1) Allowable axial load

①Calculation of allowable axial load

Accelerating/decelerating time is:

$$\alpha = \frac{V}{60\,t} = \frac{10 \times 10^3}{60 \times 0.2} = 833\ (\text{mm/s}^2)$$

$$= 0.833\ (\text{m/s}^2)$$

$$t = t_1 = t_3 = t_4 = t_6$$

①, ⑥ ……$F_1 = mg - m\alpha$

$= 300 \times 9.80665 - 300 \times 0.833$

$= 2690\ (N)$

②, ⑤ ……$F_2 = mg = 2940\ (N)$

③, ④ ……$F_3 = mg + m\alpha = 3190\ (N)$

②Buckling load

For condition in Fig. 16.7, use values below.

P = 3190 N, L_1 = 1600 mm

Bearing supporting condition is common Fixed -- Simple support.

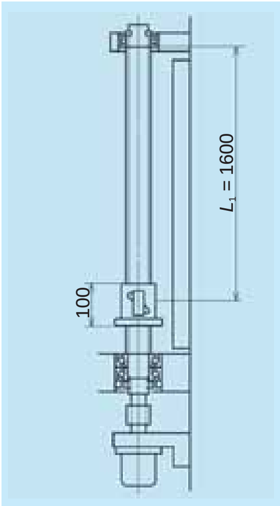

Fig. 16.7 Checking the buckling load

From Formula (Ⅱ-2) on Page B48:

$$d_r \geq \left(\frac{P \cdot L_1^2}{m} \times 10^{-4}\right)^{1/4}$$

$$= \left(\frac{3190 \times 1600^2}{10.0} \times 10^{-4}\right)^{1/4} = 16.8\ (\text{mm})$$

(2) Checking permissible rotational speed

① Critical speed

Use values below.

$n = 1000\ (\text{min}^{-1})$, $L_1 = 1600\ (\text{mm})$

From Formula (Ⅱ-7) on Page B51:

$$d_r \geq \frac{n \cdot L_1^2}{f} \times 10^{-7} = \frac{1000 \times 1600^2}{15.1} \times 10^{-7}$$

$= 17\ (\text{mm})$

②$d \cdot n$ value

From Table 3.2 on Page B54:

$$d \leq \frac{50000}{n} = \frac{50000}{1000}$$

$= 50\ (\text{mm})$

＊Please consult NSK if d • n > 50000 is required.

(4) Checking life (dynamic load rating)

Determine required load carrying capacity from load conditions of Table 16.9.

Table 16.9 Load conditions

Operating condition	Axial load (N)	Rotational speed (mean) (min^{-1})	Use time (s)
①, ⑥	F_1 = 2690	N_1 = 500	t_a = 1.4
②, ⑤	F_2 = 2940	N_2 = 1000	t_b = 13.0
③, ④	F_3 = 3190	N_3 = 500	t_c = 1.4

Calculate mean load F_m and mean rotational speed N_m from Formulas (Ⅱ-11) and (Ⅱ-12) on Page B57:

Required load carrying capacity is:

$$F_m = \left(\frac{F_1^3 \cdot N_1 \cdot t_a + F_2^3 \cdot N_2 \cdot t_b + F_3^3 \cdot N_3 \cdot t_c}{N_1 \cdot t_a + N_2 \cdot t_b + N_3 \cdot t_c}\right)^{1/3}$$

$= 2940\ (\text{N})$

$$N_m = \frac{N_1 \cdot t_a + N_2 \cdot t_b + N_3 \cdot t_c}{t}$$

$= 288\ (\text{min}^{-1})$

From Formulas (Ⅱ-8) and (Ⅱ-9) on Page B57:

$$C_a \geq (60 N_m \cdot L_t)^{1/3} \cdot F_m \cdot f_w \times 10^{-2}\ (N)$$

$= (60 \times 288 \times 24000)^{1/3} \times 2940 \times 1.2 \times 10^{-2}$

$= 26300\ (\text{N})$

(5) Checking static load rating

$C_{0a} = F_{max} \times f_s = 3190 \times 2$

$= 6380\ (\text{N})$

In consideration of expense:

Fourth selection : R Series ball screw for transfer equipment

Shaft diameter :	32 (mm)
Lead :	10 (mm)
Stroke :	
Turns of balls and circuit number :	2.5 × 2
Screw length :	2000 (mm)
Basic dynamic load rating :	35700 (N)

6. Selection of nut

Select a "standard nut with a flange and a seal (Brush-seals contained inside)" based on the necessity as well as on the environmental conditions.

Selected ball screw:

Nut assembly	RNFTL3210A5S
Screw shaft	RS3210A20

B-2-18 Guide to Technical Services

(1) CAD data

■Web page
http://www.jp.nsk.com/app01/en/catalog/

■CD-ROM
Catalog No.7110 (CD-ROM) contains precision machine components and rolling bearings.

(2) Telephone consultation with NSK engineers

This catalog contains technical explanation for each section. However, some descriptions and explanations may be insufficient due to page limitation, etc. To amend this shortcoming, NSK offers telephone assistance. NSK engineers are pleased to help you. Our local offices are listed in the last part of this catalog. Call local NSK office or representative in your area.

(3) Additional machining (processing) some part of standard ball screws in stock

NSK processes standard ball screw blank shaft end. NSK also cuts linear guide rails to required length for you. Service is available at NSK processing factories throughout the world. Requests are taken by branch offices and agencies.

B-2-19 Precautions When Handling Ball Screws

Ball screws are precision products. They require careful handling as described below.

Confirm lubrication

Lubrication

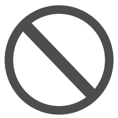
(1) Confirm the state of lubrication before use. Insufficient lubrication causes loss of ball screw functions in a short period.

(2) Use without lubrication if grease is already applied to the ball screws. Remove dust or swarf if they stuck to the greased surface during handling. Wipe with clean white kerosene, then apply the same type of new lubricant before use. Avoid using different types of grease at the same time.
Consult NSK for special oil lubricant if it is required to your application.

(3) Check lubricant after two to three months of operation. Wipe off grease if it is excessively contaminated, and apply sufficient volume of a fresh coat of grease. After the initial check, check and replenish lubricant approximately every year. Check more often if environment requires.

* Refer to Pages B71 and D13 for lubrication.

Do not disassemble



Do not reassemble

Watch out for falling objects

Handle with care

Do not apply shock

Handling

(1) Never disassemble ball screw. It invites dust to enter, and lowers precision, or may cause an accident.

(2) User should never reassemble ball screw by himself. Loss of ball screw function is apt to occur if a mistake is made. Please send ball screw to NSK for repair or re-assembly. It will be reworked at the minimum service charge.

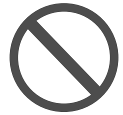
(3) Ball screw shaft or nut may fall due to its own weight. Watch out for such falling object. If it falls, the ball groove or ball recirculation component may be damaged and the function might have been lost. Make certain to return such item to NSK for check. There will be the minimum charge for this service.

(4) If recirculation component, shaft outside, or ball groove is scratched or damaged by impact, recirculation operation becomes deficient, and may cause loss of function.

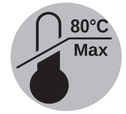
* Refer to Page B77 for assembling components.

Prevent dust

Rotational speed limitation



Do not overrun



Temperature limitation

Precautions in use

(1) Ball screws should be used in a clean environment. Use a dust cover to keep dust and swarf from entering into the system. Insufficient dust protection causes not only the ball screw function to deteriorate but also brings about damage to the recirculation components if dust plugs the system. This may result in more serious accident such as a fall of the table.

(2) For rotational speed in operation, refer to the applicable section in this catalogue which describes permissible rotational speeds, or to specification drawing furnished by NSK. Exceeding permissible rotational speed damages recirculation components, and may cause the table to fall. A precaution system such as a safety nut is recommended in vertical use of ball screw. Please consult NSK for safety system.

(3) Overrunning ball nut (removed from the ball thread) causes the balls to fall out, damages recirculation components, and dent ball groove, resulting in insufficient operation. Continued use under such conditions may cause premature wear, and damages recirculation components. For these reasons, avoid overrun by all means. If overrun occurs, please request NSK to check. There will be a minimum charge for this service.

(4) Ball screws are designed to be used at a temperature of less than 80°C. Do not operate at temperatures higher than this limit. Use at a higher temperature may damage recirculation and seal components. Please consult NSK if it is necessary to use at a temperature higher than the limit.
When using NSK K1 lubrication unit, the operating temperature should be 50°C or less. (Momentary maximum temperature in use: 80°C)

* Please read Page B84 before designing.

Store in the correct position

Storage

(1) Store in the original NSK package. Do not unwrap or tear the inner wrapping if it is not necessary. This allows dust to enter and rust to set in, and may deteriorate functions.

(2) The following position is recommended when storing ball screws.

① Keep in the NSK original package, and place it flat.

② Place flatly on supports; store in a clean area.

③ Hang vertically in a clean place.

B-3-1.1 HMD Type for High-Speed Machine Tools

This product is patented by NSK.

1. Features

● High speed

The permissible rotational speed (d·n value) has greatly increased to 160 000 compared with 135 000 of the HMC type.

● Low noise

Noise reduced by 5 dB or more compared with the HMC type ball screws for high-speed machine tools because of the end-deflector and middle-deflector systems.

● Nut mounting dimensions

The ball nut diameters are the same as those of the HMC type.

2. Specifications

(1) Recirculation system

Fig.1 shows the structure of the middle-deflector recirculation system of the HMC type.

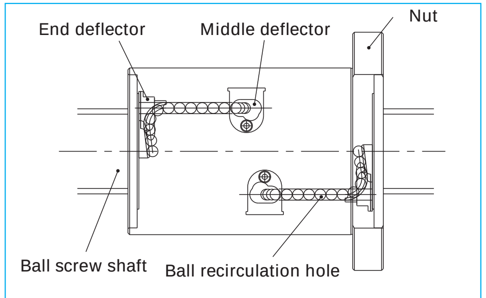

Fig. 1 Structure of middle-deflector recirculation system

(2) Accuracy grade and axial play

The available standard accuracy grade and axial play are as follows. Please consult NSK for other grades.

Table 1 Accuracy grade and axial play

Accuracy grade	C3, C5
Axial play	0 mm (Preloaded product)

(3) Allowable d·n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below.

Allowable d·n value: 160 000 or less

Criterion of maximum rotational speed : 4 000 min^{-1}

Note: Please also review the critical speed. See "Technical Description: Permissible rotational speed" (Page B51) for details.

(4) Options

● For twin-drive systems (Refer to page B143)

Upon request, the variations in lead accuracy and preload torque between two ball screws of a pair of the TW series are controlled for the further improvement of the reliability.

● Hollow shaft ball screw (Refer to page B144)

The temperature rise and measures against thermal expansion of ball screw driving mechanism are the most challenging for high-speed machine tools. For the HMD type ball screws, we recommend to utilize the hollow for forced cooling system.

(5) Seal

Compact, thin plastic seal is available. Nut outside diameter is compact compare with the return tube recirculation system.

3. Design precautions

For general precautions regarding ball screws, refer to "Design Precautions" (Page B84) and "Handling Precautions" (Page B103).

4. Product categories

The HMD type has a model as follows.

Remarks 1. The right turn screw is standard. Please consult NSK for left turn screw.
2. Rigidity listed under the K column is when a 5% dynamic load rating is applied as preload.

B-3-1.2 HMC Type for High-Speed Machine Tools

This product is patented by NSK.

1. Features

● High-speed traveling

High helix leads of 16 mm to 36 mm are used. Furthermore, the ball recirculation return tube is reinforced to make a high-speed traveling of 40 to 120 m/min. possible.

● High rigidity, high load carrying capacity

Double start thread increases the number of effective turns of balls, and a smaller ball size increases the number of the balls. Together they contribute to have high rigidity and high load carrying capacity, despite the high helix lead.

● Compact nut

The size of nut diameter and length were reduced.

Comparison with current products -- about 50% reduction in volume.

2. Specifications

(1) Recirculation System

The ball recirculation circuits and grooves are suited for high-speed operation. Structure of recirculation system is shown in Fig. 1.

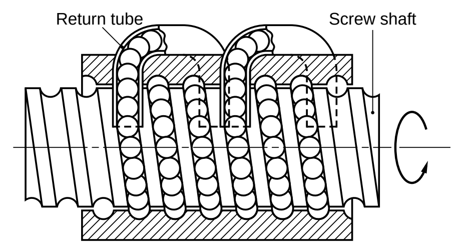

Fig. 1 Structure of return tube recirculation system

(2) Accuracy grades and axial play

Standard accuracy grades and axial play are shown in Table 1. Please consult NSK for other grade.

Table 1 Accuracy grades and axial play

Accuracy grade	C3, C5
Axial play	0 mm (Preloaded)

(3) Options

● Equipped with "NSK K1™" lubrication unit

Optional NSK K1 lubrication unit, molded from resin and impregnated with lubrication oil, is available. Please consult NSK when using NSK K1.

● For twin-drive systems (Refer to page B143)

Upon request, the variations in lead accuracy and preload torque between two ball screws of a pair of the TW series are controlled for the further improvement of the reliability.

● Hollow shaft ball screw specifications

The temperature rise and measures against thermal expansion of ball screw driving mechanism are the most challenging for high-speed machine tools. For the HMD type ball screws, we recommend to utilize the hollow for forced cooling system.

● Vertical axis type

For the vertical axis ball screw, which head load is constantly applied, a high load capacity ball screw is required. A high load capacity type with compact design is available for the nut model Ⅰ and Ⅱ in the dimension table. For details, please consult NSK.

(4) Allowable d·n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below.

Allowable d•n value: HZC, HDC; 100000 or less
HZF, HDF; 135000 or less

Criterion of maximum rotational speed: 3750 min^{-1}

Note: Please also review the critical speed. See "Technical Description: Permissible rotational speed" (Page B51) for details.

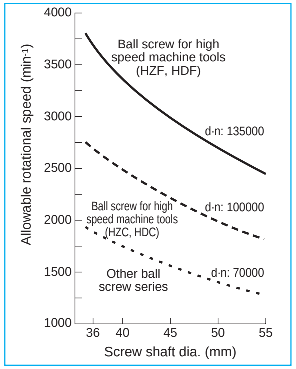

Fig. 2 Comparison of permissible rotational speed

(5) Other specifications

For other specifications not listed in the dimension tables such as high-speed, high-load capacity, and NSK K1 installed type, please consult NSK.

3. Design precautions

For general precautions regarding ball screws, refer to "Design Precautions" (Page B84) and "Handling Precautions" (Page B103).

4. Product categories

HMC type has two different preload systems with several models (Table 2).

B-3-1.3 BSL Type for Miniature Lathe

1. Features

● Prompt delivery

Screw shaft configuration and ball nut shape are standardized for prompt delivery.

● High speed and low noise

Adoption of end-deflector recirculation system realized high-speed operation with low noise.

● Excellent dust resistance

Thin plastic seal and specially designed ball grooves prevent the entry of foreign matters.

2. Specifications

(1) Recirculation system

End-deflector recirculation system has features of high-speed operation with low-noise, and compact ball nut. The structure of recirculation system is shown in Fig.1.

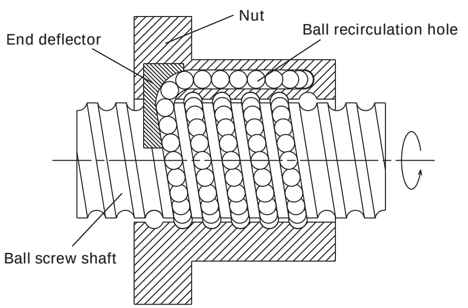

Fig. 1 Structure of end-deflector recirculation system

(2) Accuracy grade and axial play

The available standard accuracy grade and axial play are as follows. Please consult NSK for other grades.

Table 1 Accuracy grade and axial play

Accuracy grade	C5
Axial play	0 mm (Preloaded product)

(3) Allowable d·n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below.

Allowable d·n value: 180 000 or less

Criterion of maximum rotational speed : 4 000 min^{-1}

Note: Please also review the critical speed. See "Technical Description: Permissible rotational speed" (Page B51) for details.

(4) Options

Optional NSK K1 lubrication unit, molded from resin and impregnated with lubrication oil, supplies fresh oil onto ball rolling surface, ensuring long-term, maintenance-free operation. Please consult NSK when using NSK K1.

3. Design Precautions

When designing the screw shaft end, one end of the screw must meet either one of the following conditions. If not, we cannot install the ball nut on the screw shaft.

- Cut the ball groove through to the shaft end.
- The diameters of bearing journals and the gear or pulley seat must be less than the root diameter of ball groove "dr" specified on the dimension table.

Special bearings which have higher-load carrying capacity are available.

For general precautions regarding ball screws, refer to "Design Precautions" (Page B84) and "Handling Precautions" (Page B103).

4. Product categories

The BSL type has a model as follows.

Table 2 BSL type product categories

Nut models	Shape	Flange shape	Preload system
BSL		Circular Ⅲ	P Preload (Slight preload)

5. Example of model number in dimension table

A structure of "Model number" and "Reference number for ball screw" are as follows.

◇Model number

BSL 20 05

- BSL — Nut model : BSL
- 20 — Screw shaft diameter (mm)
- 05 — Lead (mm)

◇Reference number for ball screw

W 20 05 - ** P SS - C5 Z 5

- W — Product code
- 20 — Screw shaft diameter (mm)
- 05 — Effective threaded length (in the unit of 100 mm)
- ** — NSK design serial number
- P — Preload code: P; P preload
- SS — Middle-deflector recirculation system
- C5 — Accuracy grade: C5
- Z — Axial play code: Z
- 5 — Lead (mm)

6. Handling Precautions

Maximum operating temperature: 80°C

If using NSK K1, operating temperature should not exceed 50°C. Refer to "Designing Precautions" (Page B84).

B-3-1.4.1 HTF-SRC Type for High-Load Drive

1. Features

● High-speed operation and low noise

The SRC recirculation system contributes to more than twice the feed speed (d·n value: 140000 and 160000) and the noise level of less than 8 to 10 dB (half to 1/3 of noise) compared with the HTF type.

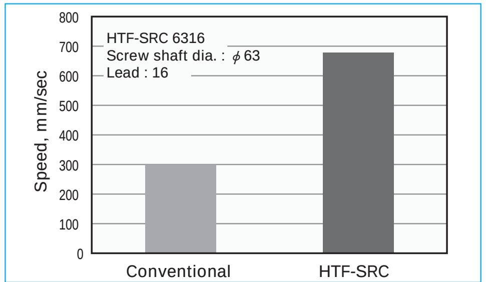

Fig. 1 Feed speed comparison

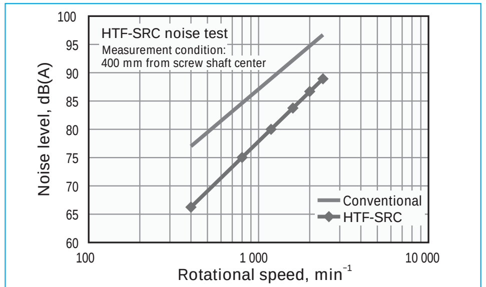

Fig. 2 Noise level comparison

2. Specifications

(1) Recirculation system

The SRC recirculation system picks up balls in the direction they are moving, and contributed high-speed operation with low noise. Structure of recirculation system is as follows.

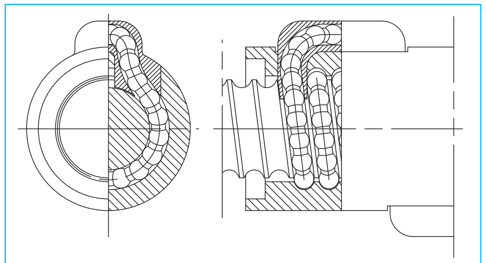

Fig. 3 Structure of SRC recirculation system

(2) Accuracy grade and axial play

The available standard accuracy grade and axial play are as follows. Please consult NSK for other grades.

Table 1 Accuracy grade and axial play

Accuracy grade	Ct7
Axial play	S,0.020 mm or less; N,0.050 mm or less

(3) Allowable d·n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below.

Table 2 Allowable d·n value and the criterion of maximum rotational speed

Lead	14, 16 mm	20, 25 mm
Allowable d·n value	160000 or less	140000 or less
Criterion of maximum rotational speed	4225 min^{-1}	

d·n value : Shaft dia. d[mm] × Rotational speed n[min^{-1}]

Note: Please also review the critical speed. See "Technical Description: Permissible rotational speed" (Page B51) for details.

(4) Ball retaining piece NSK S1™

The NSK S1, resin retainers between the balls, significantly extend ball screw durability to the moment load.

(5) Other

Please consult NSK for special requests, such as the addition of a recirculation circuit to increase the load capacity, or the arrangement of all recirculation circuits on the same phase of ball nut circumference.

3. Design Precautions

The HTF-SRC type is designed to distribute the load uniformly to the load balls for high-load drive mechanism. We recommend installing the ball screws in the way shown below for the full use of this characteristic.

In addition, we will make full analysis when you use the HTF-SRC type under extreme conditions such as application of extremely high load or operating in short stroke. Contact NSK about operating conditions. (Refer to page B31)

When designing the screw shaft end, one end of the screw shaft must meet either one of the following conditions. If not, we cannot install the ball nut on the screw shaft.

- Cut the ball groove through to the shaft end.
- The diameters of bearing journals and the gear or pulley seat must be less than the root diameter of ball groove "dr" specified on the dimension table.

For general precautions regarding ball screws, refer to "Design Precautions" (Page B84) and "Handling Precautions" (Page B103).

Remarks
1. The right hand screw is the standard. For specifications on left hand screws, contact NSK.
2. The ball nut length with no seals is shorter by M than that length of a ball nut with seals.
3. Please consult NSK if load exceeds the allowable axial load.
4. The allowable axial load is determined in accordance with the mounting conditions of ball screws recommended by NSK (Refer to page B124). If your mounting conditions differ from those provided, please consult NSK.

B-3-1.4.2 HTF-SRD Type for High-Load Drive

This product is patented by NSK.

1. Features

● High-speed operation and low noise

Used with end deflectors, HTF-SRD type ball screws achieve the maximum feed speed of 1600 mm/s. The ball nut body surface is completely round, thus enabling well balanced ball nut rotation.

Double start thread structure which has more recirculation circuits, and large diameter balls contribute to have high load carrying capacity.

● Low noise and compact design

End deflector system using a ball scooping mechanism in the direction of screw spiral offers smoother ball recirculation system, thus contributing to less than half the noise level compared with existing ball screws equipped with a return tube.

Compact, high-performance seal is available. Nut outside diameter is compact compare with the return tube recirculation system.

Also, compact, thin plastic seal is available. Nut outside diameter is compact compare with the return tube recirculation system.

2. Specifications

(1) Recirculation system

End-deflector recirculation system has features of high-speed operation with low-noise, and compact nut. The structure of recirculation parts are as follows.

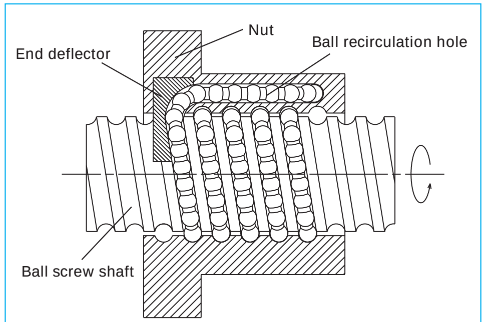

Fig. 1 Structure of End-deflector recirculation system

(2) Accuracy grade and axial play

The available standard accuracy grade and axial play are as follows. Please consult NSK for other grades.

B-3-1.4.3 HTF Type for high load drive

This product is patented by NSK.

1. Features

● High load carrying capacity

Has an ideal design to bear heavy load. It significantly enhances load rating as well as maximum permissible load.

● Abundant diameter / lead combinations

Twenty five types of shaft diameter/lead combinations are available. Please consult NSK when you require other combination.

● Respond to various shaft end configuration

Additional ball screw shaft machining is not required. HTF type responds to various shaft ends that convey high torque.

HTF type can be used with: involute spline (JIS B 1603), straight sided spline (JIS B 1601), Key seat, etc.

2. Specifications

(1) Recirculation system

Structure of recirculation system is shown in Fig. 1.

(5) Other

Please consult NSK for special requests, such as the addition of a recirculation circuit to increase the load capacity, or the arrangement of all recirculation circuits on the same phase of ball nut circumference.

3. Design precautions

For designing shaft end configuration, you should take into account that the HTF type ball screws are dedicated to high load drive.

The HTF type is designed to distribute the load uniformly to the load balls for high load drive mechanism. (This product is patented by NSK.)

We recommend installing the ball screws in the way shown in Fig. 2 for the full use of this characteristic. In addition, we will make full analysis when you use the HTF type under extreme conditions such as application of extremely high load or operating in short stroke. Contact NSK about operating conditions. (Refer to page B31)

B-3-1.5 VSS Type for Contaminated Environments

1. Features

● High dust-resistance

Specially profiled screw shaft grooves and high performance seals prevent the entry of fine contaminants. Reduces particle penetration rate to less than 1/15 of existing standard products.

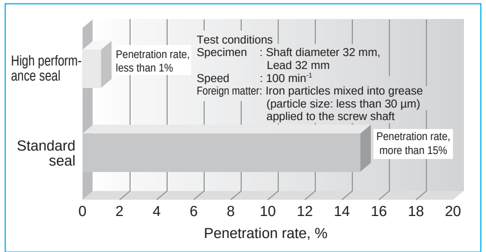

Fig. 1 Particle penetration rate

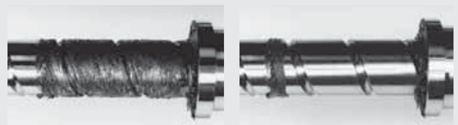

Before passage through high performance seal / After passage through high performance seal

All contaminants adhering to the screw shaft are swept away after passage through high performance seals.

Fig. 2 Contamination before and after particle penetration test

● Long life

High performance seals extend ball screw durability under severely contaminated environments with iron powder.

Extreme durability tests under contaminated environments show the durability of the VSS type extends more than four times longer than our existing type with a standard seal.

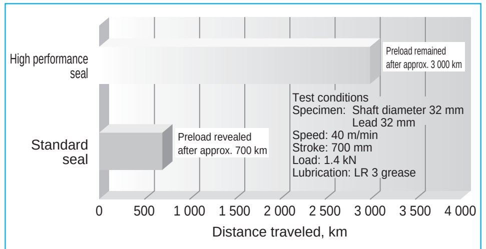

Fig. 3 Extreme durability test results using iron particles

● High speed

For ultimate smoothness of ball recirculation, the internal ball recirculation system enables high-speed operation at a maximum of d·n 150 000. Large lead specifications allow high-speeds of 150 m/min.

● Low-noise

Reduces noise level by more than 6 dB compared with our conventional tube-type ball screws, thereby providing low-noise and good noise tone features.

● Compact size

Ball nut external diameter is up to 25% smaller than our conventional models.

2. Specifications

(1) Recirculation system

End-deflector recirculation system has features of high-speed operation with low-noise, and compact ball nut. The structure of recirculation system is shown in Fig.4.

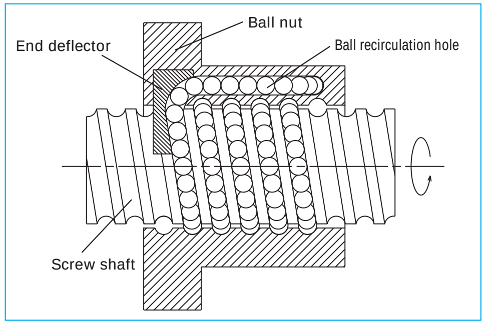

Fig. 4 Structure of end deflector recirculation system

(2) Accuracy grade and axial play

The available standard accuracy grade and axial play are as follows. Please consult NSK for other grades.

Table 1 Accuracy grade and axial play

Accuracy grade	C5
Axial play	Z, 0 mm (Preloaded) T, 0.005 mm or less; S, 0.020 mm or less

(3) Allowable d•n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below.

Allowable d·n value: 150000 or less

Criterion of maximum rotational speed: 3000 min^{-1}

Note: Please also review critical speed. See "Technical Description: Permissible rotational speed" (Page B51) for details.

(4) High performance seal

High performance seal (Japan patents: 3646452, 3692203) with special lip that contacts screw shaft cross-section and prevents entry of fine contaminants.

(5) Lubrication unit

Incorporates NSK K1 lubrication unit to sufficiently lubricate the high performance seal lip, reduce friction, and improve durability.

(6) optional

Non-contact metal protector that traces the ball screw grooves and safeguards the seal against high-temperature foreign matter.

3. Design precaution

When designing the screw shaft end, one end of the screw must meet either one of the following conditions. If not, we cannot install the ball nut on the screw shaft.

- Cut the ball groove through to the shaft end.
- The diameters of bearing journals and the gear or pulley seat must be less than the root diameter of ball groove "dr" specified on the dimension table.

High performance seals may increase torque, which may in turn increase temperature. Please consult with NSK prior to usage under severe service conditions.

For general precautions regarding ball screws, refer to "Design Precautions" (Page B84) and "Handling Precautions" (Page B103).

4. Product categories

VSS Type has the model as follows.

Table 2 VSS type product categories

Remarks
1. The right hand screw is the standard. For specifications on left hand screws, contact NSK.
2. Rigidity in the Table is theoretical value obtained from the elastic deformation between screw groove and ball when the preload is 1.5% of the basic dynamic load rating, and axial load is applied to it. Refer to "Technical Description" (Page B41) if axial load and preload differs from the conditions above, or when considering change in the deformation of the ball nut itself.
3. Products with axial play may have a partially negative play (preloaded condition) depending on screw length. Refer to "Manufacturing range of effective screw length in combination of accuracy grade and axial play. (Page B20)"

B-3-1.6 TW Series for Twin-Drive Systems

(1) Features

Variations in lead accuracy and preload torque between two ball screws, which consists of a unit of TW Series, are controlled, resulting improved travel accuracy and ball screw operating lifetime. Fig. 1 shows measures variation in lead accuracy while Fig. 2 displays an example of variation in thermal expansion between the two ball screws. Fig. 3 is a schematic diagram comparing travel accuracy between the TW Series and conventional model.

● High rigidity and long lifetime

Twin-drive systems are superior to single-drive systems in system rigidity, supporting the design of long-life feeding mechanism even if they make the shaft diameter one size smaller.

● High responsiveness to positioning commands

Twin-drive systems permit the use of screw shaft diameters that are one size smaller, thereby reducing screw shaft inertia by up to 50%, offering high responsiveness to positioning commands.

● Improved high-speed capability and noise level

Twin-drive systems allow the use of smaller screw diameters, resulting in no increase in the level of noise. The end-deflector recirculation system significantly improves high-speed capability and noise level compared with the existing return tube recirculation system, offering high-speed feeding of up to 1200 mm/min (shaft dia. 40 mm, lead 30 mm, rotational speed 4000 min^{-1}).

(3) Optional specifications

- Hollow shaft ball screw
- Provides high accuracy through the use of forced cooling. Please refer to hollow shaft ball screw (page B144) for more details.

B-3-1.7 Hollow Shaft Ball Screw for high accuracy machine tools

The increase in speed of the feeding mechanism for highly accurate positioning may require some measures against thermal expansion of the ball screw (forced cooling using hollow ball screw). NSK standardized hollowed screw shafts and shaft ends configuration (sealing section and support bearing seat). NSK recommends this as the most effective measure against thermal expansion.

1. Features

●Stable positioning accuracy

Suppresses expansion of the ball screw shaft by rising temperature, and provides stable, precise positioning.

● Prevents displacement of various sections

Minimizes deformation of the ball screw support bearings as well as of the machine base which is caused by thermal expansion of ball screw. Forced cooling keeps the heat from spreading to other sections, and prevents the processing table from deforming due to heat.

● Reduces warm-up time

Temperature does not rise high, therefore cuts machine warm-up period.

● Maintains lubricant's effect

Removes heat from the ball screw, deterring lubricant deterioration.

● Easy designing for installation

Use support bearing unit exclusive for NSK ball screws (high load capacity for machine tools, see Page B449) and seal unit (Page B147) to standardized shaft end. This makes designing of mounting ball screw easy.

2. Design precautions

Refer to HMC type, end-deflector recirculation system, return tube recirculation system, and deflector recirculation system for ball screw specifications. If the overall ball screw length exceeds 3000 mm, contact NSK. For general precautions regarding ball screw, refer to "Design Precautions" (Page B84) and "Handling precautions" (Page B497).

◇ **Handling precautions**

- Use NSK support unit (high load capacity for machine tools in Page B449) for installation in order to maintain the eccentricity between screw shaft and seal unit.
- Apply grease to the lip section for protection at the time of installation to the ball screw.
- Make certain that the drain holes (one for A Type, four for B Type) of the seal unit directly face downward when the unit is installed.

B-3-1.8 ND Series for Nut-Rotatable Drive

• This product is patented by NSK.

A nut rotatable ball screw is developed as a unit into which angular contact support ball bearings are integrated. It is best suited for an application that requires rotation of the ball nut while the screw shaft is fixed.

NDT model

1. Structure

Balls are installed between the assembly housing and the ball nut. The outer bearing rings are integrated into the assembly housing and thus, compact design are attained.
A timing pulley (prepared by the user) is directly secured to the end face of the nut.

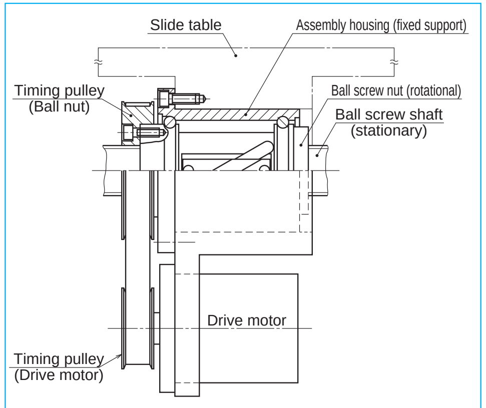

Fig. 2 Example of installation to the table

2. Features

● Multi-nut drive
Two or more nut units can be installed in a single ball screw shaft. They can be operated by respective motors.
● High operation speed
High feeding speed operation, but yet low rotational speed, is feasible by means of medium to high-helix lead ball screws.
● Easy installation
Merely install a mount housing to the table of the machine to take advantage of this multi-nut rotation system.
● Simple shaft end configuration
Shaft end configuration is simple because this unit does not need support bearings.
● Shaft diameter/lead combination
There are 10 types of "shaft diameter/lead" combinations.
Selections are: Shaft diameters -- 32, 40, 50 mm; Leads -- 20, 25, 32, 40, 50 mm.
● Low inertia
Compared to the NSK current product (end cap ball recirculation system), rotational inertia was reduced by 16% at most.

3. Specifications

(1) Recirculation system
The structure of return tube recirculation system is shown below.

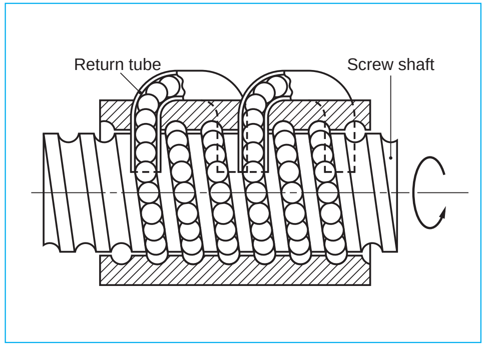

Fig. 3 Structure of ball return tube recirculation system

(2) Accuracy grade and axial play
The available standard accuracy grade and axial play are as follows. Please consult NSK for other grades.

4. Allowable d•n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below.
Note: The basic concept is the same as that of general ball screws. Refer to "Technical Description: Permissible rotational speed" (Page B51).

Table 3 Allowable d•n value and the criterion of maximum rotational speed

Allowable d·n value	Standard specification	70000 or less
	High-speed specification	100000 or less
Criterion of maximum rotational speed	3000 min^{-1}	

d·n value: shaft dia. d [mm] × Rotational speed n [min^{-1}]

● Critical speed n_c
As shown Fig. 4, calculate unsupported length (mm) of L_1, L_2, and L_3 (Assumed that the nut section is a fixed support.) Table 4 shows the coefficients "f" of each shaft end mounting condition.

$$n_c = f \bullet \frac{d_r}{L_i^2} \times 10^7 \ (\text{min}^{-1}) \qquad (\text{III-1})$$

d_r: Screw shaft root diameter [See the dimension table]
L_i: Unsupported length (mm) [See Fig. 4 Unsupported length]
f : Factor determined by the ball screw shaft end mounting condition

Table 4

5. Design precautions

One end of the screw thread should be cut-through. Also, if the nut must be removed from the screw shaft, the user should have an arbor to prevent the balls from falling out during this process. (NSK manufactures arbors on request.)
For general precautions regarding ball screws, refer to "Design Precautions" (Page B84) and "Handling Precautions" (Page B103).

NDD Type: (Incorporating vibration damper)

An increase in stroke length may restrict required rotational speed of a ball screw due to the issue of critical speed even if there is no problem on d·n limitation.

In such a case, we recommend using NDD Type nut rotatable ball screws equipped with vibration damper.

It will make it possible to operate a ball screw exceeding the critical speed, which is conventionally considered being impossible.

Note: 1) However, NDD Type cannot be used exceeding the d·n limitation. Please consult with NSK in such a case.

2) You cannot rotate the screw shaft of NDD Series.

1. Structure

Hollow ball screw shaft has a mechanism to absorb vibration energy (vibration damper). This increases dynamic rigidity of the screw shaft and lowers vibration when exceeding the critical speed.

Construction of the ball nuts are the same as those of NDT Type.

2. Features

● No need for measures against critical speed.

Conventionally, an increase in screw shaft diameter or use of intermediate support is the measure against the issue of critical speed. NDD Type ball screw will make these measures needless.

● Dimensional interchageability with NDT Type ball screws

The vibration damper is set inside a ball screw shaft, and therefore, there is no difference with existing series in regards to external dimensions. The ball nuts of NDD Type are interchangeable with those of NDT Type.

● Others

Benefits in multiple ball nut on a screw shaft, high feeding speed for long stroke, easy in installation, and low inertia of the ball nuts are the same as NDT Type.

3. Specification

Recirculation system, accuracy grade, axial play and preload system are the same as NDT Type.

4. Design precautions

They are the same as NDT Type.

5. Permissible rotational speed

The d•n value is the same as NDT Type.
You don't need to consider the critical speed.

Calculation example of permissible rotational speed

[Calculation example]
Assume a system which moves two nuts on a shaft as shown at below.
Does this system operate appropriately if: both ends of the ball screw (shaft diameter 40 mm/ lead 40 mm) are fixed, and the travel speed is at 60 m/min?

[Answer]
The rotational speed n (min^{-1}) when the lead of the ball screw is 40 mm, and the travel speed is at 60 m/min is:

$$n=\frac{60\times10^3}{40}=1500\ (min^{-1})$$

● Calculate d • n value

As the d • n value of standard specification is 7000, therefore, the permissible rotational speed is;

$$n\leq\frac{70000}{40}=1750\ (min^{-1})$$

● Calculate critical speed

The maximum unsupported length comes between Nut A and B.

L_2 = 3300 (mm)
f = 21.9 (Fixed-Fixed)
Root diameter: d_r = 35.1 (mm)

Therefore, the permissible rotational speed is;

$$n\leq\frac{21.9\times35.1}{3300^2}\times10^7=706\ (min^{-1})$$

The calculation indicates that the d • n value is at the safe level. But the critical speed exceeds the limitation. However, with a vibration damper, the system can be operated at 1500 min^{-1}.

B 156

B-3-1.9 ∑ Series for Robbot

1. Features

∑ Series (NSK's Robotte) is a ball screw with a high-performance spline. It is ideal for various actuators such as the vertical axis of SCALA type robot.

A ball screw groove and a ball spline groove are made in one shaft, combining the ball screw and the ball spline.

Mount housing, nuts, and support bearings are combined into a single unit.

Timing pulley (prepared by the user) is directly secured at the end face of the nut.

● High functions

A single shaft has both feeding mechanism and guide functions. This allows the shaft ends to move back and forth (linear motion), as well as to rotate.

● Compact and lightweight

A ball screw nut and a spline nut are placed on one shaft, and a support bearings are also combined to the unit. This allows compact and high-precision design. Hollow shaft is standard to reduce weight. The hollow can be used for wiring and piping. Other components are also designed to be light in weight.

● Low inertia

Because of return tube type ball nut of which outside diameter is decreased, low inertia design is enabled.

It reduces the inertia by 19% of conventional products.

2. Functions

As shown in Fig. 1, the ball screw nut and a spline nut are rotated independently to control rotation value. Thereby the shaft can move in any direction -- linear and rotational. Table 1 shows the relationship between power input and output.

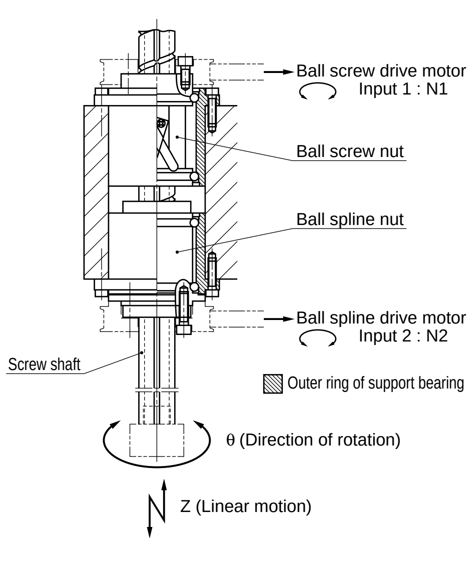

Fig. 1 Example structure of Z axis plus θ axis actuator

3. Specifications

(1) Recirculation system

A structure of return tube recirculation system is shown below.

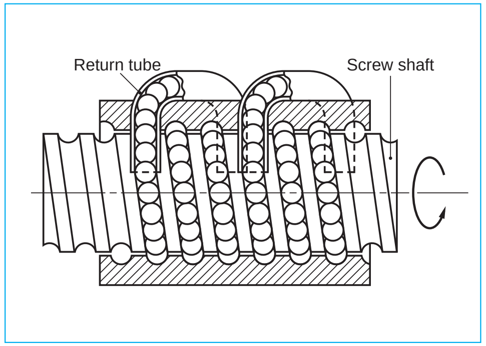

Fig. 3 Structure of return tube recirculation system

(2) Accuracy grade and axial play

The available standard accuracy grade and axial play for ball screw are as follows. The axial play for spline is 0 mm (preloaded product). Please consult NSK for other grades.

Table 2 Accuracy grade and axial play

Accuracy grade	C3, C5, Ct7
Axial play	Z, 0 mm (Preloaded) T, 0.005 mm or less; S, 0.020 mm or less

(3) Allowable d•n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below.

Permissible d•n value: 70000 or less

Criterion of maximum rotational speed: 3000 min^{-1}

Note: Please also review the critical speed.

For details, see "Technical Description: Permissible rotational speed" (Page B51).

(4) Application

SCALA type and Cartesian type industrial robots, semiconductor manufacturing machines, machines for automobile production facilities, material handling systems, other Z (vertical) axis and Z axis plus θ (rotation) axis actuators.

4. Design precautions

The overall length L can be extended to 25 times of the shaft diameter.

To remove the spline nut from the shaft for assembling, use an arbor as shown in Fig. 4. Avoid removing ball screw nut as much as possible. Refer to root diameter in the dimension table for arbor diameter. (NSK manufactures the arbors on request.)

For general precautions regarding ball screws, refer to "Precautions in Designing" (Page B84) and "Precautions in Handling" (Page B103).

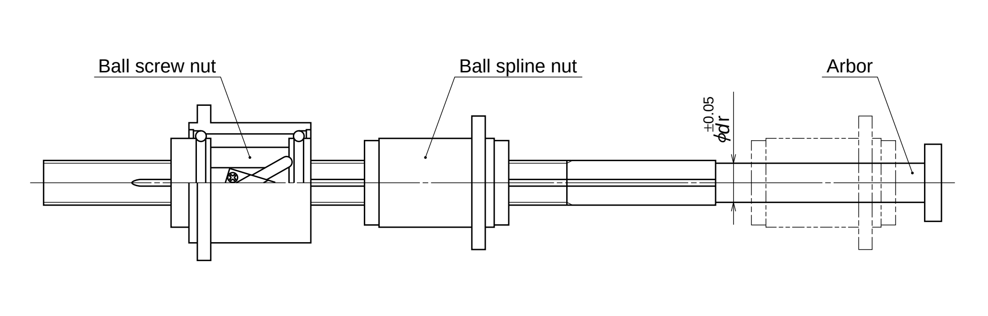

Fig. 4 Removing spline nut

5. Product categories

Σ Series (NSK's Robotte) is four models with different moving functions and performances are available. Select a standard model if rigidity is important. A compact system is recommended for reducing the weight of machine.

Table 3 Σ Series product categories

Model	Appearance	Size	Structure (Movement)
Σ		Standard	Z+θ Unit
ΣZ		Standard	Z Unit
ΣC		Compact	Z+θ Unit
ΣCZ		Compact	Z Unit

6. Load rating and life

The relationship between load rating of the ball spline section and life is the same as in other NSK liner motion products. However, various loads that apply to Robotte must be taken into account. For example, the following factors must be considered in calculating life when the product is used as shown in Fig. 5.

- Fa : Load that is generated when the shaft moves in up-down direction. (Load is applied to the ball screw nut.)
- T : Torque that is generated to the shaft by Fa.
- Fr : Load that is generated by moment of inertia of the shaft and the work attached to Robotte as well as by centrifugal force when the arm rotates.
- θ : Direction of Fr load that changes by shaft rotation.

NSK has life calculation programs which take these factors into account. Please ask NSK for more details.

B-3-1.10 Ball Screws for Transfer Equipment

1. Features

● Transporting mechanism

Ct7 and Ct10 grades series demonstrate high ball screw performance for transporting mechanism of Cartesian type robots and single axis actuators. The following types are categorized ball screw for transfer equipment. VFA and RMA types have finished shaft ends. RMS type, R series of RNFTL, RNFBL, RNCT, RNFCL, and RNSTL types have blank shaft ends.

Table 1 Classifications of ball screws for transfer equipment

Finished shaft end	VFA type, RMA type
Blank shaft end	RMS type
	R Series
	RNFTL type, RNFBL type
	RNCT type, RNFCL type, RNSTL type

● Interchangeable screw shaft and ball nut

Screw shaft and nut assembly components are sold separately, and randomly-matched. The maximum axial play after assembly is shown in the dimension tables.

2. Specifications

(1) Recirculation system

Fig. 1, 2, and 3 show the structures of ball return tube, deflector, and end cap recirculation systems. Deflector recirculation system has the feature of compact nut outside diameter for small lead. End cap recirculation system is for screws with high helix lead and multiple start threads. Since the leads are in the range larger than 1.3 times of the screw shaft diameter, it is suitable for high-speed operation.

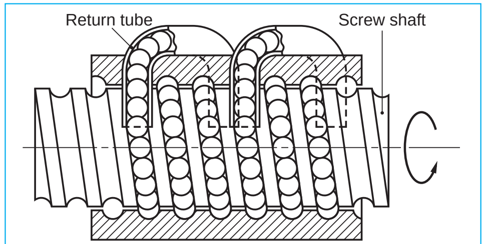

Fig. 1 Structure of return tube recirculation system

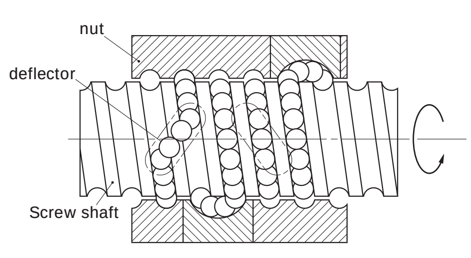

Fig. 2 Structure of deflector recirculation system

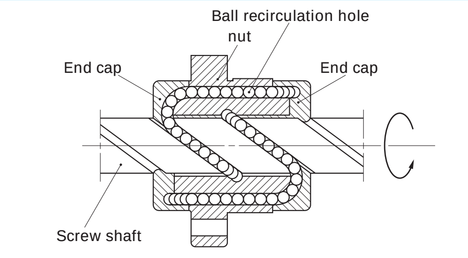

Fig. 3 Structure of end cap recirculation system

(2) Accuracy grade and axial play

Standard lead accuracy and axial play are shown on Table 2. Axial play varies with internal specification. Refer to the dimension tables.

Table 2 Accuracy grade and axial play

Accuracy grade	VFA type, RMA type, RMS type : Ct7 R Series : Ct10
Axial play	See dimension tables

(3) Allowable d·n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below.

Table 2 Allowable d·n value and the criterion of maximum rotational speed

Allowable d·n value	50000 or less
Criterion of maximum rotational speed	3000 min^{-1}

d•n value: Shaft dia. d [mm] × Rotational speed n [min^{-1}]

Note: Please also review the critical speed. See "Technical Description: Permissible rotational speed" (Page B51) for details.

3. Design precautions

For general precautions regarding ball screws, refer to "Design Precautions" (Page B84) and "Handling Precautions" (Page B497).

(1) Nut installation

Nut assembly and the screw shaft are separated at the time of delivery. Refer to "Technical description: Installation of Ball Screw" (page B77) for installation of ball nut assembly.

(2) Shaft end machining

It is necessary to machine screw shaft end of RMS and R series. Refer to "Selection Guide to NSK Ball Screw: Configuration of shaft end" (Page B27) if you use standard support units. Refer to "Technical Description: Shaft end machining" (Page B83) for procedures and precautions.

4. Product categories

Ball screws for transfer equipment have models as follows.

Table 4 Product categories of ball screws for transfer equipment

Nut models	Shape	Flange shape	Recirculation system	Preload system	Page
VFA		Flanged rectangular	Return tube type	Non-preload Slight axial play	B173 – B178
RMA RMS		Flanged Circular Ⅲ	Deflector type	Non-preload Slight axial play	B179 – B192
RNFTL		Flanged Circular Ⅰ Projecting tube type	Return tube type	Non-preload Slight axial play	B193 – B196
RNFBL		Flanged Circular Ⅱ	Return tube type	Non-preload Slight axial play	B199
RNCT		V-thread (no flange) Projecting tube type	Return tube type	Non-preload Slight axial play	B201
RNFCL		Flanged Circular Ⅲ	End cap type	Non-preload Slight axial play	B203 – B206
RNSTL		Square type	Return tube type	Non-preload Slight axial play	B207

5. Example of model number in dimension table

A structure of "Reference number for ball screw" is as follows.

◇Reference number for VFA, RMA, and RMS types

VFA 15 10 - C7 S - 500

- VFA: Ball screw for transfer equipment: VFA, RMA, RMS
- 15: Screw shaft diameter (mm)
- 10: Lead (mm)
- C7: Accuracy grade code
- S: Axial play
- 500: Screw shaft length (mm)

◇Reference number for R series

Nut assembly (example)

RNFTL 25 10 A 5 S

- RNFTL: Nut model : RNFTL, RNFBL, RNCT, RNFCL, RNSTL
- 25: Screw shaft diameter (mm)
- 10: Lead (mm)
- A: Internal design code
- 5: Effective turns of balls (turns of balls × number of circuit)
- S: Seal code S: With seal; No code: Without seal

Screw shaft (example)

RS 25 10 A 20

- RS: Product code
- 25: Screw shaft diameter (mm)
- 10: Lead (mm)
- A: Internal design code
- 20: Screw shaft length (x 100 mm)

6. Combinations of shaft diameter and lead

Combinations of shaft diameter and lead are shown below.

Remarks
1. We recommend NSK support units (page B433). WBK12SF-01 (on the simple support side) supports the ball screw directly on the shaft OD.
2. NSK grease LR3 is recommended. The amount for grease replenishing should be about 50% of nut internal space capacity. Please refer to page D16 on details.
3. Permissible rotational speed is determined by a d · n value and a critical speed. See page B169 and page B51.

Remarks
1. Protruding portion of the tube does not have any interference with the ball nut housing if its dimensions corresponding to U and V are large enough.
2. The overall screw shaft length may be slightly longer than nominal length L_0 due to manufacturing tolerance.
3. Only ball nut part numbers ending "S" are equipped with seals. External dimensions of nuts with seals are the same as those without.
In the side view of the ball nut, view above the centerline shows internal seals, and view beneath the external geometry.
Seals for shaft diameters 14 mm or less are made of synthetic resin. Seals for 16 mm diameter or greater are "Brush" seals.

Remarks
4. Nut assembly with arbor and screw shaft are shipped separately.
5. In the portion of the screw shaft reference number indicated by ··, enter the value obtained by diving the standard screw shaft length by 100 mm.
6. Items in stock do not have surface treatment. For details of standard stock products, contact NSK.
7. The internal spatial volume of nut and standard volume of grease replenishing in the dimension table are the values with seal. The amount for grease replenishing should be about 50% of nut internal space capacity.
If there is no seal, spread the screw shaft with grease or move the ball nut by hand while replenishing grease, so the grease permeates all area of nut. Please refer to page D16 for details.

Remarks

1. Protruding portion of the tube does not have any interference with the ball nut housing if its dimensions corresponding to U and V are large enough.
2. The overall screw shaft length may be slightly longer than nominal length L_o due to manufacturing tolerance.
3. Only ball nut part numbers ending “S” are equipped with seals. External dimensions of nuts with seals are the same as those without.
   In the side view of the ball nut, view above the centerline shows internal seals, and view beneath the external geometry.
   Seals for shaft diameters 14 mm or less are made of synthetic resin. Seals for 16 mm diameter or greater are "Brush" seals.

Remarks

4. Nut assembly with arbor and screw shaft are shipped separately.
5. In the portion of the screw shaft reference number indicated by ··, enter the value obtained by diving the standard screw shaft length by 100 mm.
6. Items in stock do not have surface treatment. For details of standard stock products, contact NSK.
7. The internal spatial volume of nut and standard volume of grease replenishing in the dimension table are the values with seal. The amount for grease replenishing should be about 50% of nut internal space capacity.
   If there is no seal, spread the screw shaft with grease or move the ball nut by hand while replenishing grease, so the grease permeates all area of nut. Please refer to page D16 for details.

Remarks
1. The overall screw shaft length may be slightly longer than nominal length L_o due to manufacturing tolerance.
2. Nut assembly with arbor and screw shaft are shipped separately.
3. In the portion of the screw shaft reference number indicated by ··, enter the value obtained by diving the standard screw shaft length by 100 mm.
4. Items in stock do not have surface treatment. For details of standard stock products, contact NSK.
5. The entire length of the nut becomes longer by "2 x M " for those with a seal. The seal is "Brush" seal.

Remarks
6. The internal spatial volume of nut and standard volume of grease replenishing in the dimension table are the values with seal. The amount for grease replenishing should be about 50% of nut internal space capacity.
If there is no seal, spread the screw shaft with grease or move the ball nut by hand while replenishing grease, so the grease permeates all area of nut. Please refer to page D16 for details.

B-3-1.11 Equipped with "NSK K1™" Lubrication Unit

This product is patented by NSK Ltd.

1. Features

"NSK K1™" is a new, efficient lubrication unit. Equipped with "NSK K1™", the ball screws demonstrate a superb performance as shown below.

● Long-term, maintenance-free usage

In mechanical environments where lubrication is difficult to apply, long-term running efficiency is maintained by using the "NSK K1™" in combination with grease.

[ex.] For automotive component processing lines, etc.

● Does not pollute the environment

A very small volume of grease combined with NSK K1 Seal can provide sufficient lubrication in the environment where grease is undesirable as well as in the environment where high cleanliness is required.

[ex.] Food processing/medical equipment, liquid crystal display/semiconductor manufacturing equipment, etc.

● Good for environments where lubricant is washed away

When used with grease, life of the machine is prolonged even when the machine is washed entirely by water, or in an environment where the machine is exposed to rain or wind.

[ex.] Food processing equipment, housing/construction machines, etc.

● Maintains efficiency in dusty environment

In environment where oil- and grease-absorbing dust is produced, long-term efficiency in lubrication and prevention from foreign inclusions are maintained by using the "NSK K1™" in combination with grease.

[ex.] Woodworking machines, etc.

● Comparative duration test of samples with and without NSK K1

Sample, testing conditions and test result are shown in Table 1 and Fig. 1.

Without lubricant, operation became impossible after running 8.6 km. With NSK K1 alone, it was possible to continue running exceeding 10000 km.

NSK conducts various tests under different conditions. Please consult NSK.

Table 1 Sample and testing conditions

Ball screw	Shaft dia. 20 mm, lead 20 mm
Lubrication	Comparison with only NSK K1 against no lubrication
Speed	4 000 min^{-1} (80 m/min)
Stroke	600 mm

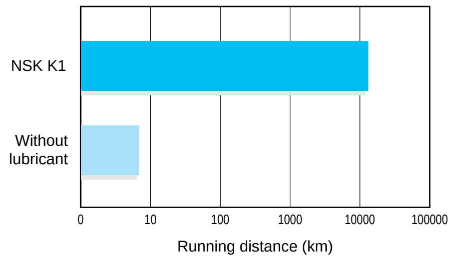

Fig. 1 Duration test results on ball screws without lubricant

2. Specifications

(1) Structure

The structure makes it possible to have a stable contact between the NSK K1 and outside of a ball screw with moderate force by a garter spring which fits onto outside of the NSK K1.

NSK K1 is installed between the ball screw nut and the labyrinth seal. The overall nut length is slightly longer than Standard ball screw.

Combination of NSK standard grease (factory-packed in the nut) and NSK K1 are standard specifications.

Fig. 2 NSK K1

(2) Accuracy grade and axial play

Accuracy grade, clearance and preload specifications remain unchanged. There is a slight increase in torque due to the equipped NSK K1.

(3) Overall nut length after equipped with NSK K1™

The nut length become longer than standard ball screw after equipped with NSK K1. The nut length after equipped K1 shown in page B211 to 214 for each recirculation. "NSK K1" can be installed on other types not listed in the dimension table, please consult with NSK.

(4) Application examples

Ball screws equipped with NSK K1 are maintenance-free for a long period of time. Its application is expanding in various industries.

Semiconductor/liquid crystal display manufacturing equipment

Industrial robot

Wood working machines

Machine tools

Automobile manufacturing machines

3. Precautions for use

Temperature range for use: Maximum temperature for use: 50˚C
Momentary maximum temperature in use: 80˚C

Chemicals that should not come to contact with K1:
Do not leave K1 Seal in organic solvent, white kerosene such as hexane, thinner which removes oil, and rust preventive oil which contains white kerosene.

Note: Water-type cutting oil, oil-type cutting oil, grease such as mineral-type AS2 and ester-type PS2 do not damage K1 Seal.

4. Example of reference number

A structure of "Reference number for ball screw" is as follows.

Note: "K1" is added at the end of "nut model code" and "Specifications number".

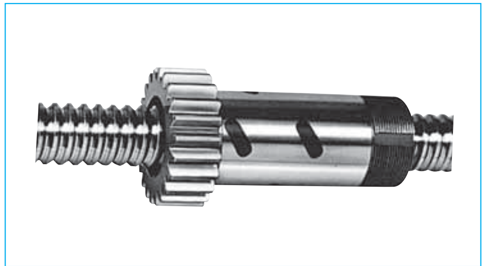
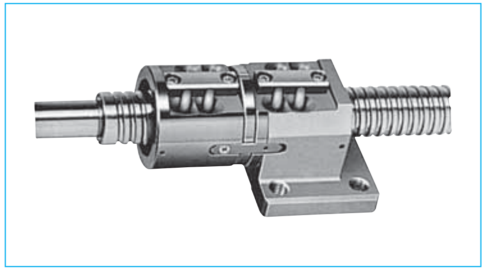
B-3-1.12 Special Ball Screws.

In addition to the standard ball screws, NSK manufactures various types of ball screws in special shapes as shown below.

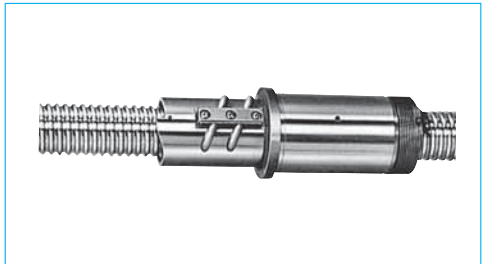
Thoroughly discuss with NSK the specifications before determining specifications and ordering ball screws in special shapes.



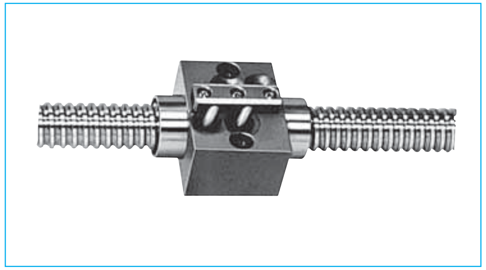
Nut with gear



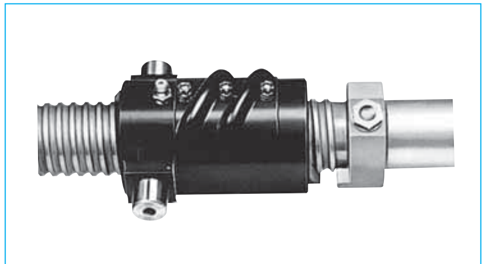
Double nut with flat mounting face



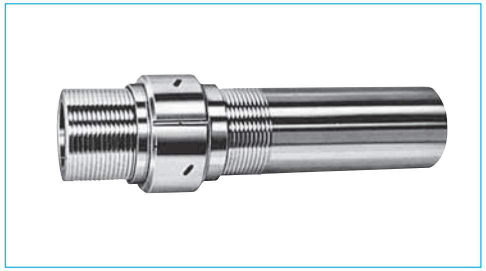
Lightly preloaded single nut with bearing seat



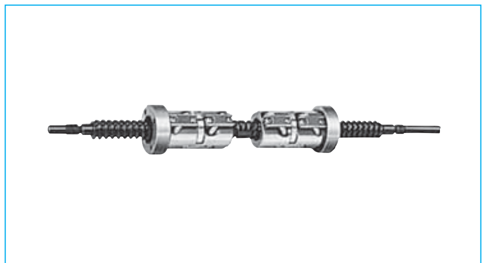
Lightly preloaded single nut with flat mounting face



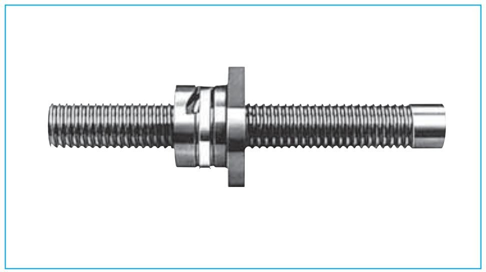
Nut with trunion



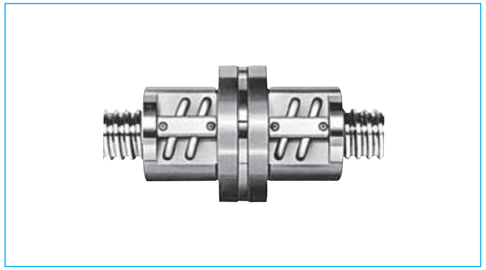
Hollow shaft, lightly preloaded single nut, with large shaft diameter and fine lead



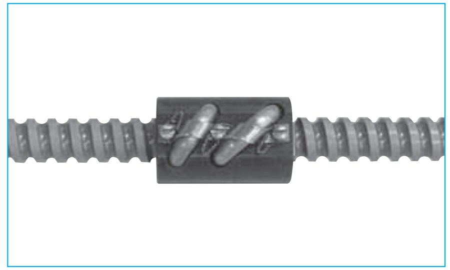
Double nut with right and left turn thread on each side of screw shaft



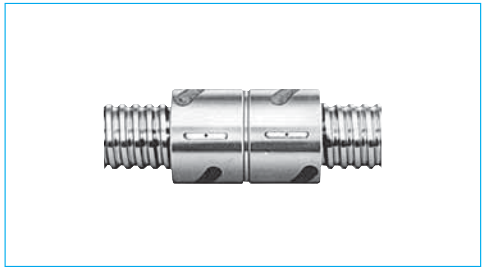
Ceramic ball screw



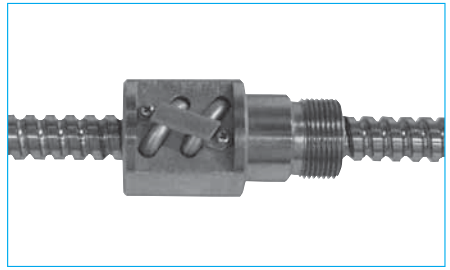
Flanged to flanged ball nut



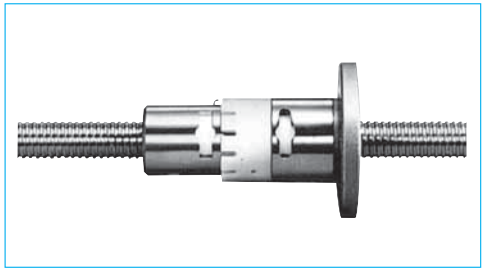
Ball screw for aircraft



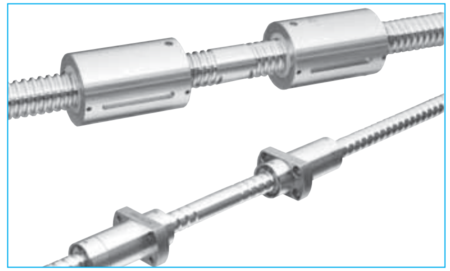
Cylindrical double nut



Ball screw for Nuclear power



Spring preload ball screw



Right and left hand thread on each side of screw

B-3-2 Dimension Table and Reference Number of Standard Ball Screws

B-3- 2.1 Compact FA PSS Type

◇**Features**

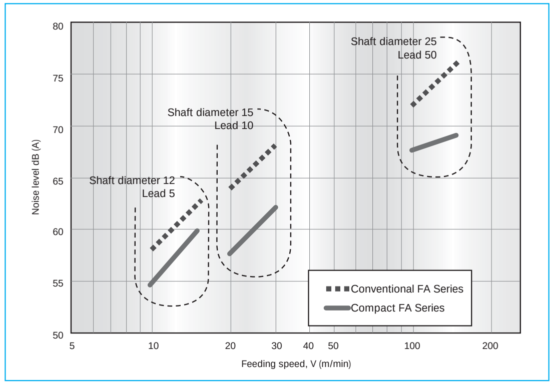
In order to respond quickly to a wide range of needs, NSK keeps end-deflector recirculation system ball screws, which offer high-speed and low-noise operation and compact design, in standard stock as the Compact FA Series. The exceptionally high performance ball screws are ready for use in a variety of fields such as semiconductor manufacturing equipment, LCD manufacturing equipment, chip mounting equipment, measuring apparatus, and medical equipment.

●**Quieter sound**

The noise level of ball screws has been reduced by 6 dB, about half of what is sensed by the ear.

●**Compact**

The outside diameter of the ball nut is as much as 30% smaller than those of NSK conventional products. This contributes to more compact design of all sorts of equipment and devices such as thinner XY tables.



(Microphone was positioned at a distance of 400 mm for all noise levels)

Fig. 1 Comparison of noise level

●**High speed**

Permissible rotational speeds up to 5 000 min^{-1}. This capability dramatically expands the range of service conditions.

Please refer to the dimension table for details of permissible rotational speed.

●**Grease fitting provided as standard equipment**

The new ball screws are standardly equipped with a grease fitting (M5 × 0.8). Lubrication ports are provided in 2 places to facilitate maintenance. The ball screws can be easily connected to an integrated lubrication system. Also, compact, thin plastic seal is available. Nut outside diameter is compact compare with the return tube recirculation system.

●**Low-profile design**

The low-profile support units especially compatible with the compact FA PSS type are available for uniquely space-saving design.

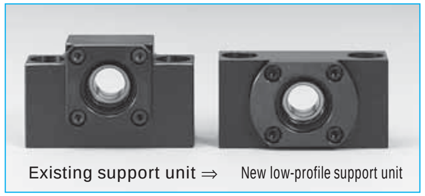


Fig. 2 Comparison of support units

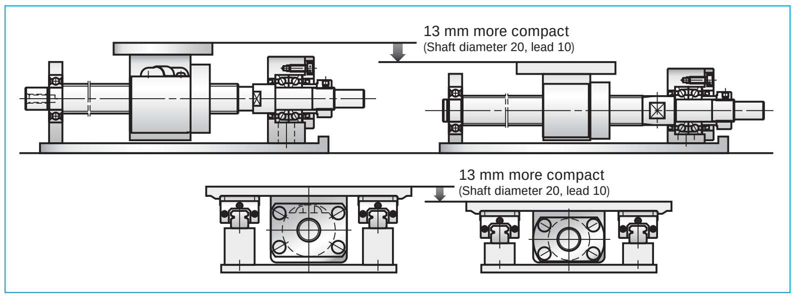

Fig. 3 Comparison of FA Type and Compact FA Series

◇**Ball screw sizes are arranged in order of the page number.**

Table begins with the smallest shaft diameter ball screw, and proceeds to the larger sizes

◇**Dimension tables**

Dimension tables show shapes/sizes as well as specification factors of each shaft diameter/lead combination. Tables also contain data as follows:

●**Stroke**

Nominal stroke: A reference for your use.

Maximum stroke: The limit stroke that the nut can move. The figure is obtained by subtracting the nut length from the effective threaded length (L1).

●**Lead accuracy**

Lead accuracy is C5 grades

T : Travel compensation;

e_p : Tolerance on specified travel;

υ_u : Travel variation

See "Technical Description: Lead accuracy" (Page B41) for the details of the codes.

●**Permissible rotational speed**

d • n: Limited by the relative peripheral speed between the screw shaft and the nut.

Critical speed: Limited by the natural frequency of a ball screw shaft. Critical speed depends on the supporting condition of screw shaft.

The lower of the two criteria, d·n and Critical Speed, will determine the overall Permissible Rotational Speed of the ball screw. For details, see "Technical description: Permissible rotational speed" (Page B51).

◇**Other**

The seal of the ball screw and end deflector are made of synthetic resin. Consult NSK when using our ball screws under extreme environments or in special environments, or if using special lubricant or oil.

For special environments, refer to Pages B74 and D2. For lubricants, refer to Pages B71 and D13.

Note: For details of standard stock products, contact NSK.

B-3-2.2 Finished Shaft End MA type, FA type, SA type

◇**Ball screw sizes are arranged in order of the page number.**

The Table begins with the smallest shaft diameter of each MA, FA, and SA type ball screws, and proceeds to the larger sizes. If ball screws have the same shaft diameter, those with smaller leads appear first. Page numbers of shaft diameter and lead combinations are shown in Table 1.

◇**Dimension tables**

Dimension tables show shapes/sizes as well as specification factors of each shaft diameter/lead combination. Tables also contain data as follows:

●**Stroke**

Nominal stroke: A reference for your use.

Maximum stroke: The limit stroke that the nut can move. The figure is obtained by subtracting the nut length from the effective threaded length (L_1).

●**Lead accuracy**

Lead accuracy is C3 and C5 grades

T : Travel compensation;

e_p : Tolerance on specified travel;

υ_u : Travel variation

See "Technical Description: Lead accuracy" (Page B41) for the details of the codes.

●**Permissible rotational speed**

d • n: Limited by the relative peripheral speed between the screw shaft and the nut.

Critical speed: Limited by the natural frequency of a ball screw shaft. Critical speed depends on the supporting condition of screw shaft.

The lower of the two criteria, d·n and Critical Speed, will determine the overall Permissible Rotational Speed of the ball screw. For details, see "Technical description: Permissible rotational speed" (Page B51).

◇**Other**

The seal of the ball screw, ball recirculating deflector, and end cap are made of synthetic resin. Consult NSK when using our ball screws under extreme environments or in special environments, or if using special lubricant or oil. For special environments, refer to Pages B74 and D2. For lubricants, refer to Pages B71 and D13.

Note: For details of standard stock products, contact NSK.

Remarks:
1. We recommend NSK support unit. Refer to Page B433 for details.
2. NSK grease PS2 is recommended. The amount for replenishing should be about 50% of the nut internal space capacity. Refer to Page D16 for details.
3. Contact NSK if permissible rotational speed is to be exceeded.

Remarks
1. We recommend NSK support unit. Refer to Page B433 for details.
2. **Only rust preventive agent is applied at time of delivery. Please apply lubricant (oil or grease) before use.** Refer to Page D13 for details.
3. Contact NSK if permissible rotational speed is to be exceeded.

B-3-2.3 Finished Shaft End Ball Screws Made of Stainless Steel KA Type

◇ **Ball screw sizes are arranged in the order of the page number.**

The table begins with the smallest shaft diameter ball screw, and proceeds to larger sizes. If ball screws have the same shaft diameter, those with smaller leads appear first. Page numbers of shaft diameter and lead combinations are shown in Table 1.

◇ **Dimension tables**

The dimension tables show shapes/sizes as well as specification factors of each shaft diameter/lead combination. Tables also contain data as follows:

●Stroke

Nominal stroke : A reference for your use.

Maximum stroke : The stroke limit that the nut can move. The figure is obtained by subtracting the nut length (plus some allowance) from the screw threaded length (L_t).

●Lead accuracy

Lead accuracy is C3 and C5 grades.

T : Travel compensation;

e_p : Tolerance on specified travel;

υ_u: Travel variation

See "Technical Description: Lead error" (Page B41) for details of the codes.

●Permissible rotational speed

d • n : Limited by the relative peripheral speed between screw shaft and nut.

Critical speed : Limited by the natural frequency of a ball screw shaft. Critical speed depends on the supporting condition of screw shaft.

The lower of the two criteria, d·n and Critical Speed, will determine the overall Permissible Rotational Speed of the ball screw. For details, see "Technical Description: Permissible rotational speed" (Page B51).

◇ **Material**

A martensitic stainless steel is used. A special heat treatment technology provides the ball groove section with sufficient hardness which produces high load carrying capacity and durability.

◇ **Other**

Seal of the ball screw, ball recirculating deflector, and end cap are made of synthetic resin. Consult NSK when using the ball screws under extreme environments or special environments, or using special lubricant or oil.

For special environments, refer to Pages B74 and D2. Refer to Pages B71 and D13 for lubricants.

Note: For details of standard stock products, contack NSK.

NSK Clean Grease LG2 is recommended.
2. Contact NSK if permissible rotational speed is to be exceeded.

B-3-2.4 Blank Shaft End MS Type, FS Type, SS Type

◇ Ball screw sizes are arranged in order of the page number.

The dimension table begins with the smallest shaft diameter of each MS, FS and SS type ball screws, and proceed to larger sizes. If ball screws have the same shaft diameter, those with smaller leads appear first. Page numbers of shaft diameter and lead combinations are shown in the Table 1.

◇ Dimension tables

The dimension tables show shapes/sizes as well as specification factors of each shaft diameter/lead combination. Tables also contain data as follows:

● Lead accuracy

Lead accuracy is C3 and C5 grades.

T : Travel compensation;

e_p : Tolerance of specified travel;

υ_u : Travel variation

See "Technical description: Lead accuracy" (Page B41) for details of the codes.

● Permissible rotational speed

d • n: Limited by the relative peripheral speed between the screw shaft and the nut.

Critical speed : Limited by the natural frequency of a ball screw shaft. Critical speed depends on the supporting condition of screw shaft.

Criterion of maximum rotational speed
: 3000 min^{-1}

The lower of the two criteria, d·n and Critical Speed, will determine the overall Permissible Rotational Speed of the ball screw. For details, see "Technical description: Permissible rotational speed" (Page B51).

◇ Shaft end processing

MS, FS, and SS types require shaft end processing to your specification. An exclusive support unit (Page B433) is available to design the shaft end support section. See "Configuration of shaft end" (Page B27 and following pages) when using a support unit. See "Technical Description: Shaft end processing" (Page B83) for procedures of shaft end processing and precautions.

◇ Other

Seal of the ball screw, ball recirculating deflector and end cap are made of synthetic resin. Consult NSK when using the ball screws under extreme environments or special environments, or using special lubricant or oil.

For special environments, refer to Pages B74 and D2. Refer to Pages B71 and D13 for lubricants.

Note: For details of standard stock products, contack NSK.

Remarks: 1. NSK support unit is recommended. Refer to Page B433 for details.
2. Only rust preventive agent is applied at time of delivery. Please apply lubricant (oil or grease) before use.
Refer to Page D13 for details.
3. Permissible rotational speed is determined by a d·n value and a critical speed. See page B383 and B51.

B-3-2.5 Accessories

Accessories to use with ball screw are available in stock.

① **Classification**

Ball screw support units are classified into categories by their shape (Table 1). Select the type that is appropriate for you to use.

② **Features**

●Short delivery time: Standardized items in stock

●Bearings and seal

On the fixed support side, the angular contact ball bearing is used. It has great rigidity and low friction torque which match the rigidity of the ball screw. The thrust angular contact ball bearing with high precision and great rigidity is another choice for the fixed support side.

An oil seal is installed on fixed support side used with an angular contact ball bearing. The seal may have fine clearance.

A deep-groove ball bearing with a shield on both sides is used on the simple support side.

●Lock nut is provided.

A lock nut of fine grade finish is provided to fix the bearing with high precision.

③ **Reference number coding**

(For light load)

Example : WBK 08 S - 01 A

- WBK — Product code for support unit
- 08 — Nominal size code*
- S — Mounting code
  - No code:Fixed support unit
  - S:Simple support unit
  - SF:Simple support unit (for VFA)
  - R:Fixed support unit (support kit for miniature ball screws)
- 01 — 01: Square type / 11: Round type
- A — No code or A: For general use / C: For clean environment use

* In case of simple support unit, be careful that 12 or less size codes do not represent internal bores of bearing. Please refer to the dimensional table for internal bore of bearing.

(For heavy load)

Example : WBK 25 DF - 31

- WBK — Product code for support unit
- 25 — Nominal size code (internal bore of bearing)
- DF — Bearing combination code
  - DF : Face to face duplex combination
  - DFD : Face to face triplex combination
  - DFF : Face to face quadruplex combination

(1) Support Units for Light Load and Small Equipment

Support units for light load and small equipment provide both fixed and support side bearing assemblies to support screw shafts. They provide all required parts such as bearing locknuts so that you can mount them directly to NSK standard ball screws, of which shaft ends are machined.

Please refer to the dimensions listed on the dimension table for configuration of standard screw shaft ends for NSK standard ball screws with blank shaft ends. For transporting ball screws, you require optional spacers when mounting fixed support side support units.

①**Features**

●Prompt delivery

All support units are standard stocked items.

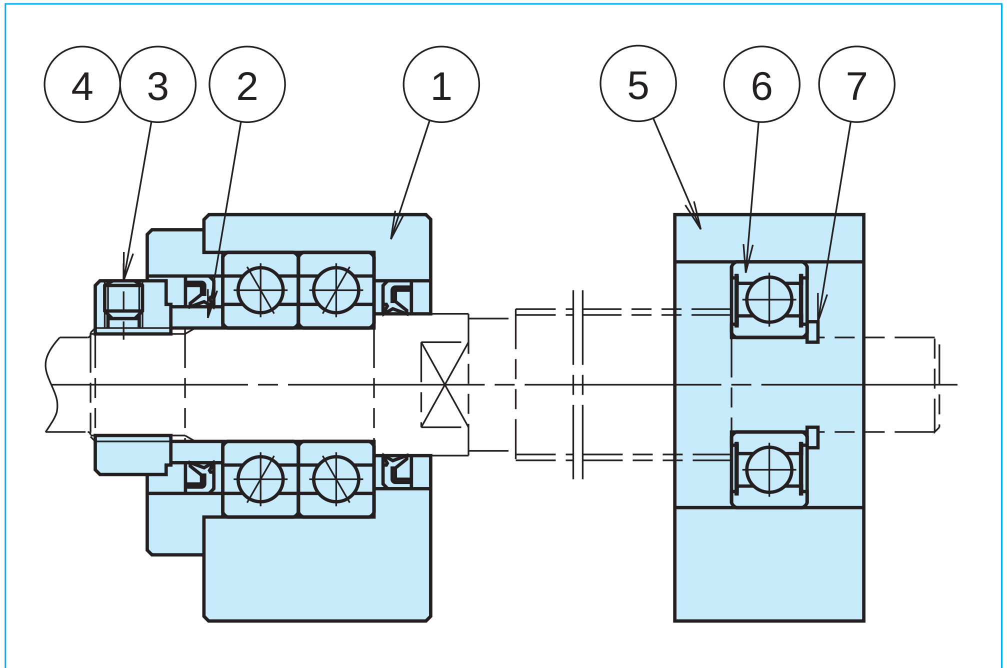
●Best selection of bearings for your application

General use support units for fixed support side are equipped with highly rigid angular contact ball bearings that have been assembled with proper preload, and packed with the appropriate volume of grease. On the other hand, clean support units for fixed support side uses low dust emission grease, and low torque special bearings. Sealed deep groove ball bearings are used for simple support side units for both general and clean environment use.

●Accessories

Support units provide everything necessary for mounting ball screws to machines. (Please refer to the table below.)

* Do not disassemble fixed support side units as they are equipped with bearings and oil seals.



●Antirust treatment

The table on the right shows the surface treatment for the bearing housing, and material of small parts.

Fixed support side		Simple support side	
Part no.	Name of parts	Part no.	Name of parts
①	Bearing housing	⑤	Bearing housing
②	Spacer	⑥	Bearing
③	Locknut	⑦	Snap ring
④	Set screw with set piece		

	General support unit
Bearings and grease	Angular contact ball bearings, PS2
Surface treatment	Black oxide
Screws and snap rings	Standard material

⑥Features of Clean Support Unit

●Outstanding low dust emission

Clean support unit uses "NSK clean grease LG2" which has a proven feature of low dust emission. It reduces dust emission to 1/10 of general support units.

●Low torque

It features low torque characteristics because of special bearings. (50% lower than general support unit.)

●High antirust specification

Low temperature chrome plating is applied to bearing housings, retaining plates, locknuts and spacers to improve antirust properties. Moreover, bolts and snap rings are made of stainless steel.

The table below shows the surface treatment of the bearing housing and material of small parts.

	Clean support unit
Bearing • grease	Special bearings, LG2
Surface treatment	Low temperature chrome plating
Set screw and snap ring material	Stainless steel

Notes:
1. Oscillate bearings slowly so that they fall into a place to make run-out of mounting face minimal, and then tighten a locknut.
2. A support kit is put on a provisional shaft (bolt) for shipping.
3. When securing support unit on the shaft, insert the set piece (brass pad) that is provided with the support unit into the lock nut screw hole, and then tighten the set screw.

Notes:
1. Use datum face A for mounting to the machine base.
2. This type of simple side support unit is made exclusively for NSK VFA ball screws. This unit supports the outer diameter of the screw shaft.

Spacer

The shaft requires an optional spacer on the journal where the ball thread is cut through the bearing shoulder. This is common for R series for transportation ball screw shaft, when mounting the support unit for fixed support side.

(2) Dimensions of support unit for ball screws for heavy-load/machine tools

Support units for heavy-load/machine tools use a thrust angular contact ball bearing (TAC Series) with high rigidity and accuracy. The thrust angular contact ball bearing has very suitable functions and structure as a ball screw support bearing.

There are three combinations as shown below.

Parts list

Part number	Part name	Quantity
①	Housing	1
②	Retaining cover	1
③	High accuracy thrust angular contact ball bearing	One set
④	Dust seal	2
⑤	Collar	2
⑥	Preload bolt	6 or 8
⑦	Shim	One set
⑧	Lock nut	1

Remarks

1. Mount sections A and B to the machine base.
2. NSK support units are precisely preloaded and adjusted. Components ①, ②, ③, ④, ⑥, ⑦ are assembled into a unit. Do not disassemble.
3. Grease is packed into the bearings.
4. Lock nut ⑧ is exclusively prepared for ball screw. The end face of the nut is in strict control being precisely perpendicular to the V thread. Secure the lock nut using the set screw.
   Lock nut is also available as an accessory (See page B453). Refer to Page B457 as well for high-precision thrust angular contact ball bearing (TAC Series).

Remarks 1. Rigidity

Values in the Table are theoretical values obtained from the elastic deformation between the groove and the balls.

2. Starting torque

Starting torque indicates torque due to the preload of the bearing. It does not include seal torque.

3. The tolerance of the shaft bearing seat

We recommend h5 class of the fits tolerance.

4. Dimensions with * (asterisk) mark

*Pilot diameter and tapped screws marked with "asterisk *" are used for seal unit installation for NSK standard hollow shaft ball screws. They also can be used for dust cover and damper installation.

5. Grease is packed into the bearing. It is not necessary to apply grease before use.

In addition to the support units, NSK has other components for the ball screw as shown below.

(3) Lock nuts

Ball screw support bearing must be installed with minimum inclination. NSK lock nuts exclusive for ball screw help to reduce this inclination.

(4) Grease unit

NSK has numerous grease types that are exclusive for ball screw lubrication. They come in bellows-shaped tubes, that can be attached to a grease gun quickly. For details of grease types, refer to Page D13 or for grease pump and nozzles, refer to Page D20.

(5) Travel stopper (by order)

A travel stopper is installed in some cases to prevent the nut from overrunning due to the malfunction of the safety system of the equipment or by human error. NSK has several types of series of shock-absorbing travel stoppers. Please request NSK for installation.

The travel stopper is not sold as a single item since it does not have a general use. Also, a travel stopper cannot be used for end cap type recirculation system, because the stopper would come directly into contact with the ball recirculating portion.

Thrust Angular Contact Ball Bearing for Ball Screw

(1) Features

This is highly rigid and accurate ball screw support bearing often used for the machine tool driving mechanism.

① High axial rigidity
Uses many balls, and set high contact angle at 60 degrees.

② Small friction torque
Friction torque is smaller than that of tapered or cylindrical roller bearing. This contributes to accurate rotation by a small driving power.

③ Axial play is pre-adjusted
Combination bearings are already adjusted to a suitable preload. Universal combination bearing (SU) furnishes certain preload for all combinations (DB, DF, and other).

④ Simple mounting structure
A duplex combination of bearings can receive axial and radial loads. Therefore, the installation structure is simpler than when both a thrust bearing and a radial bearing are used.

⑤ Easy handling
Inner and outer rings are inseparable, and are easy to handle.

⑥ Superb polyamide resin retainer
Uses polyamide resin retainer which is superb to friction and furnishes high precision rotations.

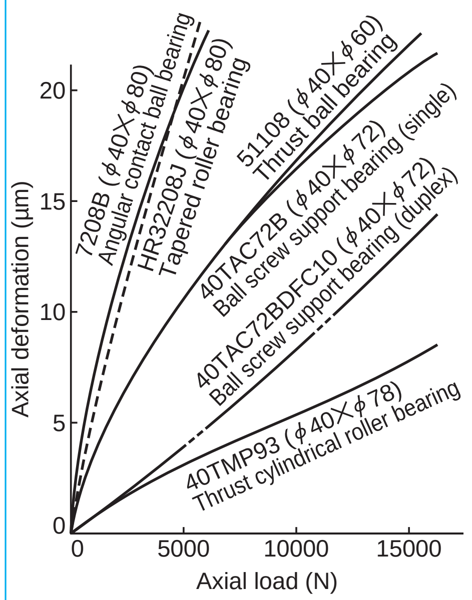

Fig. 1 Axial rigidity of various bearings

Table 2 Comparison with other types of bearings

Bearing type	Bearing rigidity (See Fig. 1)	Starting torque	Preload adjustment	Installation structure
Thrust angular contact ball bearing for NSK precision ball screw support unit	High	Low	Not required	Simple
Combined angular contact ball bearing	Low	Low	Not required	Simple
Combination of tapered roller bearings	Low	High	Complicated	Simple
Thrust ball bearing and radial bearing	High	Low	Complicated	Complicated
Thrust cylindrical roller bearing and radial bearing	Extremely high	Extremely high	Complicated	Complicated

Note : Consult NSK when you use these bearings other than the purpose of ball screw support.

(2) Composition of reference number

30 TAC 62 B DF C10 PN7A

- 30 — Bearing bore (mm)
- TAC — Bearing model code
- 62 — Bearing outside diameter (mm)
- B — Internal design code
- DF — Combination code
- C10 — Axial play code
- PN7A — Accuracy

Remark : As "30 TAC 62 B," any part of the first half of the reference number is referred to as "nominal size" in this catalog.

(3) Bearing combinations

Generally, a set uses more than two pieces (referred to as 'two rows') of bearings and, thus the preload is applied.
There are two types of combination:

● **Bearing combination**
Bearings are adjusted as a single combined set. Since the bearing alignment is pre-set, there is no interchangeability;

● **Universal combination bearing (SU)**
A combination of independent bearings, which is manufactured as a single bearing. Bearings are randomly-matched to obtain required preload by more than one of randomly picked up bearings.

① **Bearing combination**

- Figure 2 shows examples of combinations. There is "V" mark on the outside surface of the bearing to avoid misarrangement. A complete letter "V" should be formed when all bearings align correctly to form a set.
- DF combination which easily absorbs misalignment with the ball screw nut is used in general.

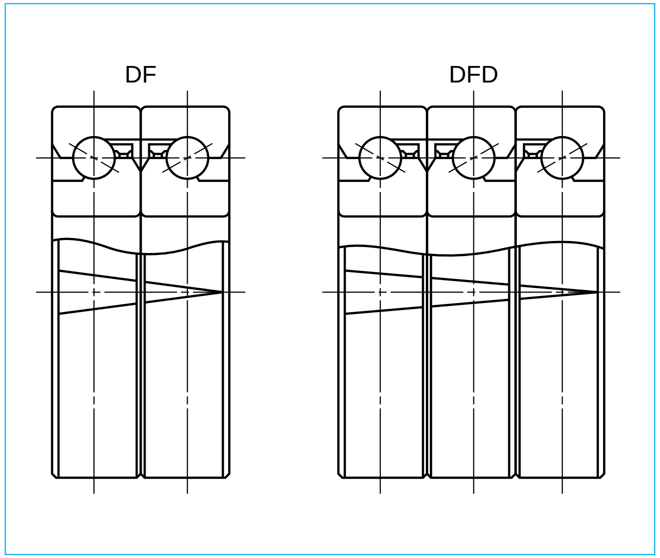

Fig. 2 Examples of combination and "V" mark

② **Universal combination bearing (SU)**

- Unlike the above case, marks on the bearing outside surface do not form a letter "V." The tip of the "V" on each bearing simply indicates the direction to which axial load can be applied.

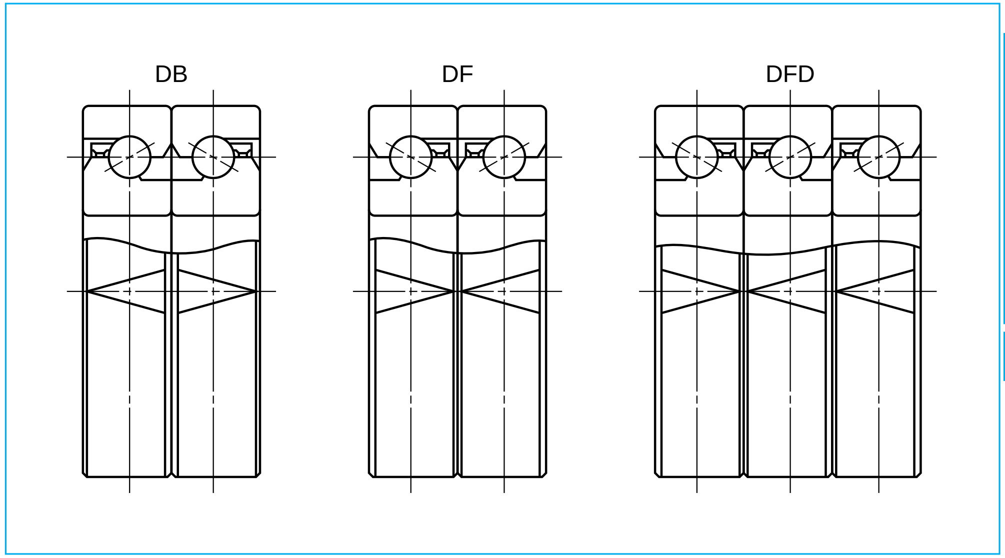

Fig. 3 Example of universal combination (SU) and "V" mark

(4) Preload, rigidity, and starting torque

The table 3 shows preload, rigidity (spring modulus), and starting torque with grease lubrication. (The starting torque should be 1.4 times higher when oil is used as a lubricant.)
Consult NSK for the bearing combinations not included in the Table below.

(5) Accuracy

① Accuracy grades
Uses NSK standard PN7A and PN7B which are equivalent to JIS4 grade of the radial ball bearing.
Combined bearing ———————PN7A
Universal combination bearing —— PN7B
However, PN7A is stricter than JIS4 grade regarding axial run out of inner and outer rings. PN7B is stricter regarding the tolerance of the bore and outside diameter (Table 4).

② Fits
Table 5 shows recommended values of the tolerance of shaft and housing bore.

"Two rows" means two bearings are receiving axial load.

B-3-3 Dimension Table and Reference Number of Standard Nut Ball Screws

B-3-3.1 End Deflector Type Ball Screw

NSK has a patent for this product.

1. Features

●Silent and high quality of sound

The average noise level is reduced by more than 6 dB compared with our conventional products. At low-speed rotation, the ball screws are nearly silent, while the lowest noise level is achieved at high-speed rotation.

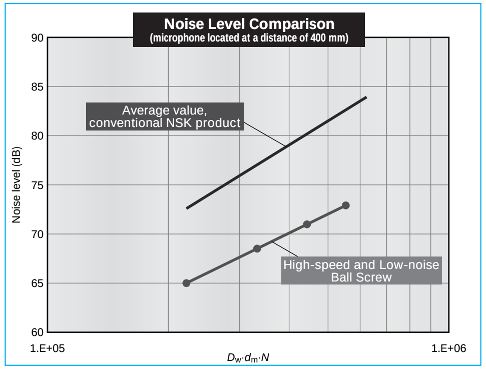

Fig. 1 Comparison of noise level

●High-speed operation

Realizes at d·n 180000 outstanding for ball screws and far surpassing the 100000 d·n performance of conventional return tube type products. For high lead ball screws, high-speed operation at over 200m/min is also possible.

●Compact

The external diameter of the ball nut is 30% smaller than our conventional models. Compact configurations are possible for low-profile XY tables as well as for other devices and equipment.

●Grease fitting provided as standard equipment

The ball screws with shaft diameters of less than ø25 are standardly equipped with a grease fitting (M5 × 0.8). Lubrication ports are provided in 2 places to facilitate maintenance. The ball screws can be easily connected to an integrated lubrication system.

2. Specifications

(1) Recirculation system

Fig. 2 shows the structure of the end-deflector recirculation system.

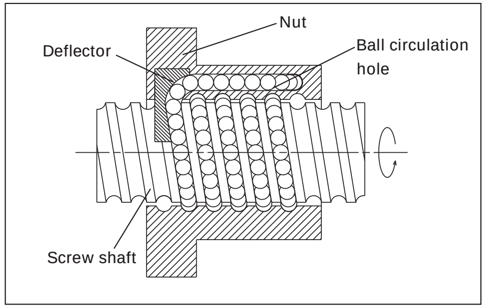

Fig. 2 Structure of end-deflector recirculation system

(2) Accuracy grade and axial play

The available standard accuracy grade and axial play are as follows. Please consult NSK for other grades.

Table 1 Accuracy grade and axial play

Accuracy grade	C0, C1, C2, C3, C5, Ct7
Axial play	Z, 0 mm (Preload); T, 0.005 mm or less S, 0.020 mm or less; N, 0.050 mm or less

(3) Allowable d·n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below.

Allowable d·n value : 180000 or less
Standard of rotational speed : 5000 min^{-1}

Note: Please also review the critical speed. See "Technical Description: Permissible rotational speed" (Page B51) for details.

(4) Seal

Compact, thin plastic seal is available. Nut outside diameter is compact compare with the return tube recirculation system.

(5) Option

Optional NSK K1 lubrication unit, molded from resin and impregnated with lubrication oil, supplies fresh oil onto ball rolling surfaces, ensuring long-term, maintenance-free operation. Please contact NSK when using NSK K1.

3. Design precautions

When designing the shaft end of a ball screw which diameter is 25 mm or less, or 32 mm or over, and the lead is the same as its shaft diameter, one end of the screw must meet either one of the following conditions. If not, we cannot install the ball nut on the screw shaft.

- Cut the ball groove through to the shaft end.
- The diameters of bearing journals and the gear or pulley seat must be less than the root diameter of ball groove "dr" specified on the dimension table.

For general precautions regarding ball screws, refer to "Design Precautions"(Page B84) and "Handling Precautions"(Page B103).

4. Product categories

End deflector type has a model as follows.

B-3-3.2 Return Tube Type Ball Screw

1. Features

Return tube type is standard recirculation system for ball screws. It has various combinations of shaft dia. and lead.

2. Specifications

(1) Recirculation system

The structure of return tube recirculation system is shown below.

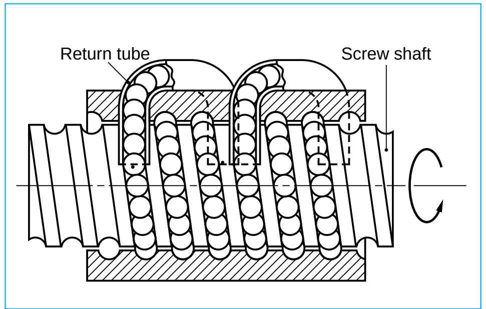

Fig.1 Structure of return tube recirculation system

Table 1 Accuracy grade and axial play

Accuracy grade	SFT, PFT, ZFT, DFT: C0, C1, C2, C3, C5, Ct7 LSFT, LPFT, LDFT: C1, C2, C3, C5, Ct7 (Ct7 is not included in DFT, LDFT)
Axial play	Z, 0 mm (Preload); T, 0.005 mm or less S, 0.020 mm or less; N, 0.050 mm or less

(2) Accuracy grade and axial play

The available standard accuracy grade and axial play are shown in Table 1. Please consult NSK for other grades.

(3) Allowable d·n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below. Basic measure must be taken for the high speed ball screws respectively.

Allowable d·n value :

Standard specification ; 70000 or less

High-speed specification; 100000 or less

Standard of rotational speed : 3000 $\min^{-1}$

Note: Please also review the critical speed. Refer to "Technical Description: Permissible rotational speed" (Page B51) for details.

(4) Other specifications

Please consult NSK for other specifications not listed in the dimension tables.

3. Product categories

There are four different preloaded systems with several models. Since the leads are in the range from 1/2 to the same length of the shaft diameter (medium-high helix lead), LSFT, LPFT, LDFT Type ball screws are suitable for high-speed operation.

Table 2 Return tube type ball screws product categories

Remarks:
1. Nut flange for shaft diameter 16 mm or smaller comes in rectangular shape.
2. Seals are equipped as a standard for LSFT and LPFT of shaft diameter 12 mm or smaller. The outside dimensions are the same as those of without seals.
3. The right turn screw is standard. "L" is added to the end of the model code for the left turn screw.

Remarks
4. The axial rigidity in the table above is a theoretical value obtained from the elastic deformation between screw groove and ball when the axial load is 30% of the basic dynamic load rating (C_a) with clearance, 10% with D preload, and 5% with P preload. Refer to "Technical description" (Page B41) if axial load differs from the conditions above, or when considering change in the deformation of the ball nut itself.
5. For PFT and LPFT, the basic load ratings differ from the other models as the spacer balls are installed.
6. The models marked with * are in FA type of standard ball screw with finished shaft end.

Remarks:
1. Nut flange for shaft diameter 16 mm or smaller comes in rectangular shape. It comes in circular shape I and circular shape II for shaft diameter 20 mm or larger. Select a flange that is suitable for the space available for nut installation.
2. If there is no seal for PFT, SFT, and DFT, the nut length "L" is shortened by dimension "M".
3. The right turn screw is standard. "L" is added to the end of the model code for the left turn screw.
4. The axial rigidity in the table above is a theoretical value obtained from the elastic deformation between screw groove and ball when the axial load is 30% of the basic dynamic load rating (C_a) with clearance, 10% with D preload, and 5% with P preload. Refer to "Technical description" (Page B41) if axial load differs from the conditions above, or when considering change in the deformation of the ball nut itself.
5. For PFT and LPFT, the basic load ratings differ from the other models as the spacer balls are installed.
6. The models marked with ∗ are in SA type of standard ball screw with finished shaft end.
7. Preload system: P, Oversize ball preload; Z, Offset preload; D, Double nut preload (Refer to Page B5)

Remarks:
1. Nut flange for shaft diameter 16 mm or smaller comes in rectangular shape. It comes in circular shape I and circular shape II for shaft diameter 20 mm or larger. Select a flange that is suitable for the space available for nut installation.
2. If there is no seal for PFT, SFT, and DFT, the nut length "L" is shortened by dimension "M".
3. The right turn screw is standard. "L" is added to the end of the model code for the left turn screw.
4. The axial rigidity in the table above is a theoretical value obtained from the elastic deformation between screw groove and ball when the axial load is 30% of the basic dynamic load rating (C_a) with clearance, 10% with D preload, and 5% with P preload. Refer to "Technical description" (Page B41) if axial load differs from the conditions above, or when considering change in the deformation of the ball nut itself.
5. The models marked with * are in SA type of standard ball screw with finished shaft end.
6. Preload system: Z, Offset preload; D, Double nut preload (Refer to Page B5)

2. The entire nut length (L) is the size without seal. The size with a seal is longer by the size of "MS."

B-3-3.3 Deflector Type Ball Screws

1. Features

Deflector type has the smallest nut compared to the other recirculation systems, and suitable for fine lead operation.

2. Specifications

(1) Recirculation system

It has a compact nut outside diameter, and suits for small lead driving. Fig.1 shows the structure of the deflector recirculation system.

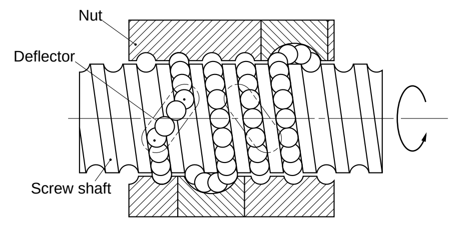

Fig. 1 Structure of deflector recirculation system

Table 1 Accuracy grade and axial play

Accuracy grade	C0, C1, C2, C3, C5, Ct7 (Ct7 is not included in DFD)
Axial play	Z, 0 mm (Preload); T, 0.005 mm or less S, 0.020 mm or less; N, 0.050 mm or less

(2) Accuracy grade and axial play

The available standard accuracy grade and axial play are shown in Table 1. Please consult NSK for other grades.

(3) Allowable d·n value and the criterion of maximum rotational speed

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK if the rotational speed exceeds the permissible range below. Basic measure must be taken for the high speed ball screws respectively.

Allowable d·n value:
- Standard specification ; 84000 or less
- High-speed specification; 100000 or less

Standard of rotational speed : 3000 min^{-1}

Note: Please also review the critical speed. Refer to "Technical Description: Permissible rotational speed" (Page B51) for details.

(4) Other specifications

Please consult NSK for other specifications not listed in the dimension tables.

Table 2 Deflector type ball screw product categories

Nut model	Shape	Flange shape	Preload system
MSFD		Flanged Circular Ⅲ	Non-preload, Slight axial play
MPFD			P preload (light preload) no spacer ball
SFD		Screw shaft diameter of 16 mm or smaller : Flanged Screw shaft diameter of 20 mm or smaller : Rectangle CircularⅠ, Ⅱ	Non-preload, Slight axial play
ZFD		Flanged Circular Ⅰ, Ⅱ	Z preload (medium preload)
DFD		Flanged Circular Ⅰ, Ⅱ	D preload (medium preload) (heavy preload)

3. Product categories

There are four different preload systems (Table 2). Synthetic resin that shows superb characteristics against wear is used in the recirculation deflector for MSFD, MPFD, and has enhanced the smooth recirculation of balls.
NSK has a patent for this product.

4. Design Precautions

When designing the screw shaft end, one end of the screw must meet either one of the following conditions. If not, we cannot install the ball nut on the screw shaft.

- Cut the ball groove through to the shaft end.
- The diameters of bearing journals and the gear or pulley seat must be less than the root diameter of ball groove "dr" specified on the dimension table.

For general precautions regarding ball screws, refer to "Design Precautions" (Page B84) and "Handling Precautions" (Page B103).

5. Example of model number in dimension tables

A structure of "Model number" and "Reference number for ball screw" are as follows.

◇Model number

SFD 40 08 - 4

- SFD — Nut model: SFD, ZFD, DFD, MSFD, MPFD
- 40 — Screw shaft diameter (mm)
- 08 — Lead (mm)
- 4 — Effective turns of balls (Note)

Note: In case of ZFD, the number here is twice as large as the effective turns of balls.

◇Reference number for ball screw

W 40 08 - ** D Y - C3 Z 5

- W — Product code
- 40 — Screw shaft diameter (mm)
- 08 — Effective threaded length (in the unit of 100mm)
- ** — NSK design serial number
- D — Preload code: No code, non-preload; Z, Z preload; D, D preload; P, P preload
- Y — Deflector recirculation system
- C3 — Accuracy grade code: C0, C1, C2, C3, C5, C7(Ct7)
- Z — Axial play code: Z, T, S, N
- 5 — Lead (mm)

Remarks
1. If the shaft OD is less than 6 mm or the lead is less than 1 mm, a seal is not installed in the nut. (Refer to Page B72 for dust protection.)
2. Ball nuts with shaft diameters under 14 mm do not have oil holes.
3. Right turn screw is standard. Please consult NSK for left turn screw.

Remarks
4. The axial rigidity in the table above is a theoretical value obtained from the elastic deformation between screw groove and ball when the axial load is 30% of the basic dynamic load rating (C_a) with clearance, 10% with D preload, and 5% with P preload. Refer to "Technical description" (Page B41) if axial load differs from the conditions above, or when considering change in the deformation of the ball nut itself.
5. The models marked with * are in MA type of standard ball screw with finished shaft end.
6. Preload system: P; Oversize ball preload (Refer to Page B5)

Remarks
1. It comes in circular shape I and circular shape II for shaft diameter 20 mm or larger. Select a flange that is suitable for the space available for nut installation.
2. If there is no seal for SFD, ZFD, and DFD, the nut length "L" is shortened by dimension "M". For MSFD and MPFD, the nut length is the same as those with seal.
3. The right turn screw is standard. "L" is added to the end of the model code for the left turn screw. Please consult NSK for MSFD, MPFD.

Remarks
4. The axial rigidity in the table above is a theoretical value obtained from the elastic deformation between screw groove and ball when the axial load is 30% of the basic dynamic load rating (C_a) with clearance, 10% with D preload, and 5% with P preload. Refer to "Technical description" (Page B41) if axial load differs from the conditions above, or when considering change in the deformation of the ball nut itself.
5. It is recommended to use with seal when shaft diameter is 16 mm or larger and have oil hole.
6. The models marked with * are in MA type of standard ball screw with finished shaft end.

Remarks
1. It comes in circular shape I and circular shape II for shaft diameter 20 mm or larger. Select a flange that is suitable for the space available for nut installation.
2. If there is no seal for SFD, ZFD, and DFD, the nut length "L" is shortened by dimension "M". For MSFD and MPFD, the nut length is the same as those with seal.
3. The right turn screw is standard. "L" is added to the end of the model code for the left turn screw. Please consult NSK for MSFD, MPFD.

Remarks
4. The axial rigidity in the table above is a theoretical value obtained from the elastic deformation between screw groove and ball when the axial load is 30% of the basic dynamic load rating (C_a) with clearance, 10% with D preload, and 5% with P preload. Refer to "Technical description" (Page B41) if axial load differs from the conditions above, or when considering change in the deformation of the ball nut itself.
5. It is recommended to use with seal when shaft diameter is 16 mm or larger and have oil hole.
6. The models marked with * are in SS type of standard ball screw with blank shaft end.
7. Preload system: Z, Offset preload; P, Oversize ball preload; D, Double nut preload (Refer to Page B5)

B-3-3.4 End Cap Type Ball Screw

1. Features

End cap recirculation system is suitable for high helix lead and multiple start threads.
Since the leads are 1 to 3 times larger than their screw shaft diameter, it makes them more suitable for high speed operation.

2. Specifications

(1) Recirculation system

The structure of end cap recirculation system is shown in Fig. 1.

(2) Accuracy grade and axial play

The available standard accuracy grade and axial play are shown in Table 1. Please consult NSK for other grades.

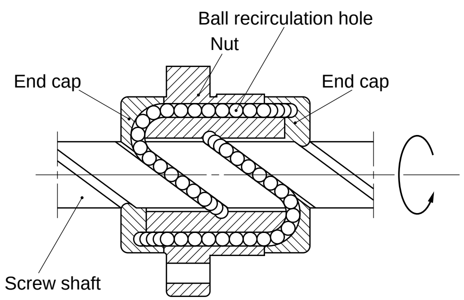

Fig. 1 Structure of end cap recirculation system

Table 1 Accuracy grade and axial play

Accuracy grade	LSFC, LPFC: C1, C2, C3, C5, Ct7 USFC, UPFC: C3, C5, Ct7 (Three times lead or over are C5, Ct7)
Axial play	Z, 0 mm (Preload); T, 0.005 mm or less, S, 0.020 mm or less; N, 0.050 mm or less

(3) Allowable d·n value and the criterion of maximum rotational speed.

Allowable d·n value and the criterion of maximum rotational speed are shown below. Please consult NSK for high-speed specification. Basic measure must be taken for the high speed ball screws respectively.

Allowable d·n value:
Standard specification ; 80000 or less
High-speed specification; 100000 or less
Standard of rotational speed : 3000 min^{-1}

※Please also review the critical speed. Refer to "Technical Description: Permissible rotational speed" (Page B51) for details.

(4) Other specifications

Please consult NSK for other specifications not listed in the dimension tables.

3. Product categories

There are two different preload systems with several models (Table 2).

Table 2 End cap type ball screws product categories

Nut model	Shape	Flange shape	Nut shape	Preload system
LSFC		Flanged Circular Ⅲ	Circular	Non-preload, Slight axial play
LPFC			Circular	P preload (light preload) no spacer ball
USFC		Flanged Rectangular	Circular	Non-preload, Slight axial play
UPFC			Circular	P preload (light preload) no spacer ball

4. Design Precautions

When designing the screw shaft end, one end of the screw must meet either one of the following conditions. If not, we cannot install the ball nut on the screw shaft.

- Cut the ball groove through to the shaft end.
- The diameters of bearing journals and the gear or pulley seat must be less than the root diameter of ball groove "dr" specified on the dimension table.

Special bearings which have higher-load carrying capacity are available.
For general precautions regarding ball screws, refer to "Design Precautions" (Page B84) and "Handling Precautions" (Page B103).

5. Example of model number in dimension tables

Remarks
1. For LSFC and USFC type ball screws, rigidities in the table are theoretical values obtained from the elastic deformation between the screw groove and the ball when the axial load is 30% of the basic dynamic load rating (C_a). For LPFC and UPFC type, rigidities are theoretical values when the preload is 10% of the basic dynamic load rating (C_a) and an axial load is applied to it. Refer to the "Technical Description" (Page B41) if the preload differs from the conditions above, or when considering a change in the deformation of the ball nut itself.
2. The right turn screw is standard. Please consult NSK for left turn screw.
3. The models marked with * are in FA type of standard ball screw with finished shaft end.
4. Preload system: P; Oversize ball preload (Refer to Page B5)

C-1 Monocarrier™

C-1-1 Features

NSK's Monocarrier is the culmination of technology and innovation in linear motion. This lightweight, compact single axis linear actuator integrates quality NSK ball screw, linear guide and support bearings into one unit.

4 Long term maintenance free

- ◯Use of NSK K1 Lubrication Units and grease maintains a smooth lubricating performance for long periods in mechanical environments where lubrication is difficult to apply, where use of oil is not permitted because of hygienic issues, or where the mechanical equipment is subjected to frequent wash downs.
- ◯NSK K1 lubrication unit is available for food processing machines and medical equipment.
- ◯Grease for clean environments and for general machinery is available.

2 All -in-one structure

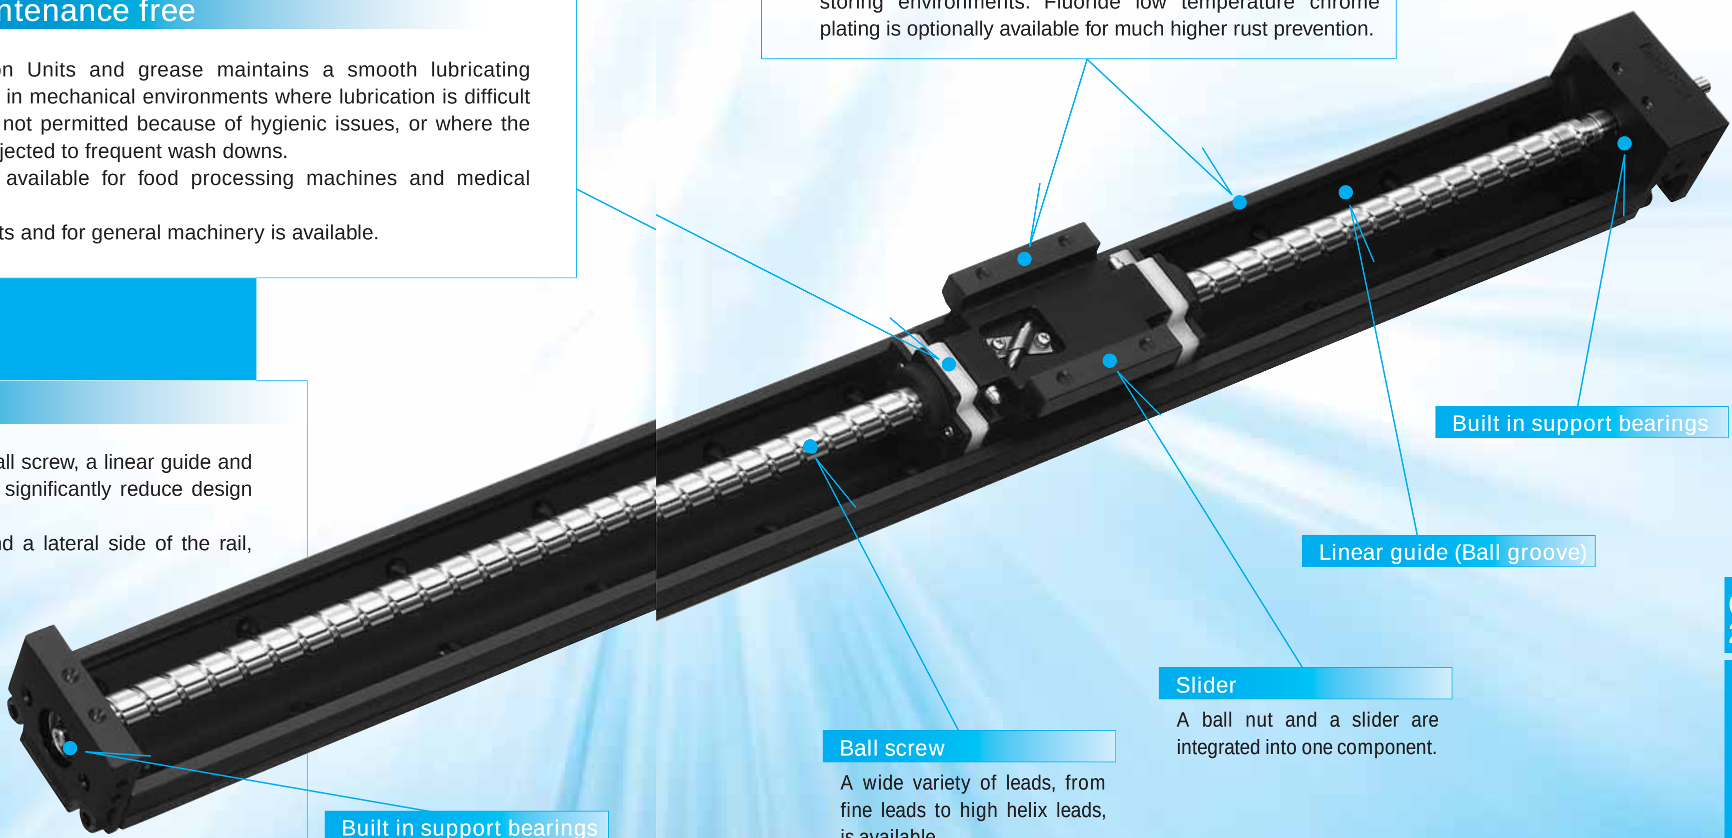
- ◯The all-in-one structure integrates a ball screw, a linear guide and support bearings into a single unit to significantly reduce design and installation time.
- ◯Multiple datum planes, the bottom and a lateral side of the rail, facilitate highly accurate installation.
- ◯Immediate operation after installation and run-in is possible.
- ◯A wide selection of fine to high helix leads are available.

1 Light weight, compact design

◯Available in two different shapes of cross-section, depending on application.
Light weight type : MCM Series
Rigid type : MCH Series
The design has minimal space requirements.

3 Superb antirust capability

◯Low temperature chrome plating is a standard feature for the bodies and sliders to control rusting in normal operating and storing environments. Fluoride low temperature chrome plating is optionally available for much higher rust prevention.



Slider
A ball nut and a slider are integrated into one component.

Ball screw
A wide variety of leads, from fine leads to high helix leads, is available.

④ Intermediate plate for motor mounting : Available for a variety of models.
Note: We assemble optional components upon request.

C-1-4 Selection of Monocarrier

C-1-4. 1 Procedures for Selecting Monocarrier

Select a reference type of Monocarrier based on stroke and rigidity (Refer to Fig. 4.2, 4.3).

Select a ball screw lead referring to "C-1-4.3 Maximum Speed" so that the rotational speed does not exceed the limit.

Study the loads to be applied to the linear guide and obtain the equivalent load (Fe) substituting them for equation ① or ② on Page C13. Obtain the mean effective load (Fm) substituting them for equation ③ on Page C14, then calculate the life.

Study the loads to be applied to the ball screw and support unit. Obtain the mean effective load (Fm) substituting them for equation ③ on Page C14, then calculate the life.

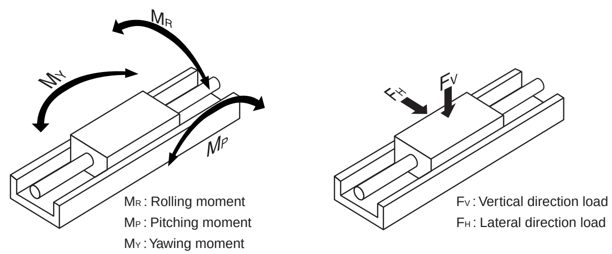

Fig. 4.5

C-1-4. 7 Estimation of Life Expectancy

(1) Life of Linear Guide

Study the load to be applied to the linear guide of Monocarrier (Fig. 4.6). The equivalent load (Fe) is determined by substituting the load for equation ① (Eq.② : in case of the tightly coupled double slider type).

● In case of the single slider

$$Fe = Y_H F_H + Y_V F_V + Y_R \varepsilon_R M_R + Y_P \varepsilon_P M_P + Y_Y \varepsilon_Y M_Y \cdots ①$$

● In case of the double slider

$$Fe = \frac{Y_H F_H}{2} + \frac{Y_V F_V}{2} + Y_R \varepsilon_{Rd} M_R + Y_P \varepsilon_{Pd} M_P + Y_Y \varepsilon_{Yd} M_Y \cdots ②$$

F_H : Lateral direction load acting on the slider (N)
F_V : Vertical direction load acting on the slider (N)
M_R : Rolling moment acting on the slider (N · m)
M_P : Pitching moment acting on the slider (N · m)
M_Y : Yawing moment acting on the slider (N · m)
ε_R, ε_{Rd}
: Dynamic equivalent coefficient to rolling moment
ε_P, ε_{Pd}
: Dynamic equivalent coefficient to pitching moment
ε_Y, ε_{Yd}
: Dynamic equivalent coefficient to yawing moment

Refer to Table 4.14 about Dynamic equivalent coefficient.

Y_H, Y_V, Y_R, Y_P, Y_Y
: 1.0 or 0.5

At equations ① and ② for obtaining equivalent load Fe, among F_H, F_V, $\varepsilon_P M_P$, $\varepsilon_R M_R$, $\varepsilon_Y M_Y$, the maximum load is assumed to be 1.0, and others are to be 0.5.

Note: Parenthesized figures are Dynamic equivalent coefficient in case of the Monocarrier without NSK K1.

In case when the load acting on the slider may fluctuate (In general, M_P, M_Y may fluctuate with the acceleration/deceleration of slider), the mean effective load is determined by Eq. ③.

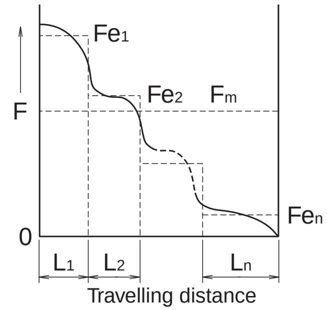

Fig. 4.7 Stepwise Fluctuating Load

Travelling distance under the equivalent load Fe_1 : L_1
Travelling distance under the equivalent load Fe_2 : L_2
. . . .
Travelling distance under the equivalent load Fe_n : L_n

$$Fm = \sqrt[3]{\frac{1}{L}\left(Fe_1^3 L_1 + Fe_2^3 L_2 + \cdots Fe_n^3 L_n\right)} \cdots ③$$

Fm : Mean effective load of fluctuating loads
L : Total travelling distance

The life of linear guide is calculated by Eq. ④

$$L = L_a \times \left(\frac{C}{f_w \cdot Fm}\right)^3 \cdots\cdots ④$$

L : Life of linear guide (km)
Fm : Mean effective load acting on the linear guide (N)
C : Basic dynamic load rating of the linear guide (N)
L_a : Travelling distance (km)
f_w : Load factor (Refer to Table 4.15)

When the estimated life does not clear the required life, the life of the linear guide is to be calculated again after the following measures are taken:

1. Change from the single slider type to double slider type.
2. Use a larger size Monocarrier.

(2) Life of Ball Screw (Support unit)

The mean effective load is determined from the axial loads.

For calculation of the mean effective load, use Eq.③.

The life of ball screw is calculated by Eq. ⑤.

$$L = \ell \times \left(\frac{C_a}{f_w \cdot Fm}\right)^3 \times 10^6 \cdots\cdots ⑤$$

ℓ : Lead of ball screw (mm)
L : Life of ball screw (mm)
C_a : Basic dynamic load rating of the ball screw (N)
Fm : Mean effective load acting on the ball screw (N)
f_w : Load factor (Refer to Table 4.15)

The life of a support unit is calculated by Eq. ⑤.
If the life of ball screw / support unit does not clear the required life, use a larger size Monocarrier.
After applying the calculations mentioned above, selection of the Monocarrier is completed.

Table 4.15 Values of load factor f_w

Operating conditions	Load factor f_w
At smooth operation with no mechanical shock	1.0 – 1.2
At normal operation	1.2 – 1.5
At operation with mechanical shock and vibrations	1.5 – 3.0

C-1-4. 8 Example of Life Estimation

This section offers an example how to estimate the life of Monocarrier based on the life of each component.

<<Example of calculation-1>>

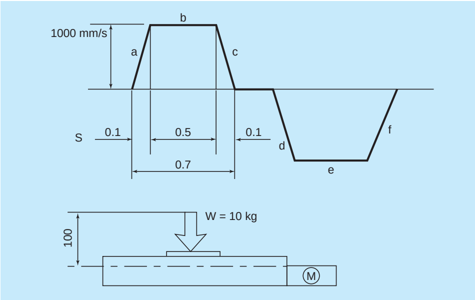

Fig. 4.8

1. Use condition
   - Stroke : 600 mm
   - Maximum Speed : 1000 mm/s
   - Load Mass : W = 10 kg
   - Acceleration : g = 9.8 m/s²
   - Setting Position : Horizontal
   - Operating Profile : See above figure

2. Selection of Nominal size (Interim Selection)
Firstly, select a greater ball screw lead as the maximum speed is 1000 mm/s. The interim selection is MCM06060H20K00, a single slider specification MCM06 that has 600 mm stroke, as the stroke is 600 mm.

3. Calculation
3-1. Linear guide
3-1-1. Fatigue life
Multiply the result of the Eq. ① by the dynamic equivalent coefficient (Table 4.14 single slider) to convert the load volume. From above operation profile,

i) Constant speed $Fe_1 = Y_V F_V = Y_V W_g = 1 \cdot 10 \cdot 9.8 = 98$ N

ii) Accelerating $Fe_2 = Y_V F_V + Y_P \varepsilon_P M_P = 0.5 \cdot 10 \cdot 9.8 + 1 \cdot 65.1 \cdot 0.1 \cdot 100 = 700$ N

iii) Decelerating $Fe_3 = Y_V F_V + Y_P \varepsilon_P M_P = 0.5 \cdot 10 \cdot 9.8 + 1 \cdot 65.1 \cdot 0.1 \cdot 100 = 700$ N

Mean effective load Fm

$$Fm = \sqrt[3]{\frac{1}{L}\left(Fe_1^3 \cdot L_1 + Fe_2^3 \cdot L_2 + Fe_3^3 \cdot L_3\right)}$$

$$= \sqrt[3]{\frac{1}{600}\left(98^3 \cdot 500 + 700^3 \cdot 50 + 700^3 \cdot 50\right)}$$

$$= 387 \text{ N}$$

$$L = \left(\frac{C}{f_w \cdot F_m}\right)^3 \times L_a$$

$$= \left(\frac{15900}{1.2 \cdot 387}\right)^3 \times 20$$

$$= 8.02 \times 10^5 \text{ km}$$

3-1-2. Static safety factor; Divide the basic static load rating by the maximum load.

$$F_S = \frac{C_0}{Fe} = \frac{C_0}{Fe_2} = \frac{17000}{700} = 24.2$$

3-2. Ball screw
3-2-1. Fatigue life; Obtain the axial load of each stage of operation referring to the operation profile, then calculate the mean load.
By the process above,

i) Constant speed
$Fe_1 = \mu \cdot W \cdot g = 0.01 \cdot 10 \cdot 9.8 = 0.98$

ii) Accelerating
$Fe_2 = Fe_1 + W\alpha = 101$ N

iii) Decelerating
$Fe_3 = Fe_1 - W\alpha = 99$ N

Axial mean effective load Fm

$$Fm = \sqrt[3]{\frac{1}{L}\left(Fe_1^3 \cdot L_1 + Fe_2^3 \cdot L_2 + Fe_3^3 \cdot L_3\right)}$$

$$= \sqrt[3]{\frac{1}{600}\left(0.98^3 \cdot 500 + 101^3 \cdot 50 + 99^3 \cdot 50\right)}$$

$$= 55 \text{ N}$$

$$L = \left(\frac{C_a}{f_w \cdot F_m}\right)^3 \times \ell \times 10^6$$

$$= \left(\frac{4560}{1.2 \cdot 55}\right)^3 \times 20 \times 10^6 \text{ (mm)}$$

$$= 6.5 \times 10^6 \text{ km}$$

3-2-2. Static safety factor; Divide the basic static load rating by the maximum axial load.

$$F_S = \frac{C_{0a}}{Fe} = \frac{C_{0a}}{Fe_2} = \frac{7750}{101} = 76.7$$

3-2-3. Maximum rotational speed; According to the table of maximum speed on page C7, MCM06 with 20 mm lead and 600 mm stroke, is possible to operate under the maximum speed of 1000 mm/s.

3-3. Support unit
3-3-1. Fatigue life; Use the axial load Fm = 55 N, that is the result of above calculation 3-2-1.

$$L = \left(\frac{C_a}{fw \cdot Fm}\right)^3 \times \ell \times 10^6 = \left(\frac{6550}{1.2 \times 55}\right)^3 \times 20 \times 10^6 \text{ (mm)}$$

$$= 1.95 \times 10^7 \text{ km}$$

3-3-2. Static safety factor; Divide the limit load by the maximum axial load.

$$F_S = \frac{C_{0a}}{Fe} = \frac{C_{0a}}{Fe_2} = \frac{2730}{101} = 27.0$$

3-4. Result

MCM06060H20K00	Linear guide	Ball screw	Support unit
Fatigue life	8.02×10^5 km	6.5×10^6 km	1.95×10^7 km
Static safety factor	24.2	76.7	27.0

In this case, the linear guide has the shortest fatigue life of the components. Therefore, the linear guide fatigue life is used as the life of the Monocarrier. The interim selection of MCM06060H20K00, that is chosen based on the use conditions, satisfies the required life.

<<Example of calculation-2>>

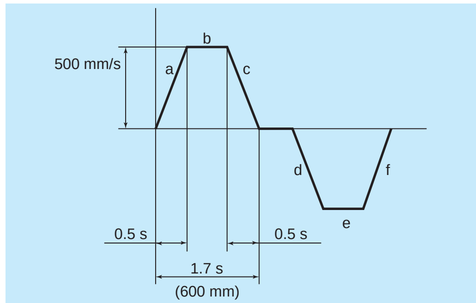

Fig. 4.9

1. Use condition
   - Stroke : 600 mm
   - Maximum Speed : 500 mm/s
   - Load Mass : W = 20 kg
   - Acceleration : 9.8 m/s²
   - Setting Position : Vertical
   - Operating Profile : See above figure

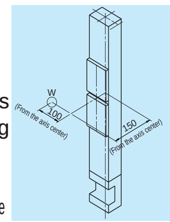

Fig. 4.10

2. Selection of Nominal size (Interim Selection)
Select a 10 mm lead ball screw as the maximum speed is 500 mm/s.
The interim selection is MCM08068H10D00 as a double slider specification of MCM08 has 680 mm stroke, and the setting position is vertical.

3. Calculation
3-1. Linear guide
3-1-1. Fatigue life; Multiply the result of the Eq. ② by the dynamic equivalent coefficient (Table 4.14. double slider) to convert the load volume. From operation profile (Fig. 4.9), the acceleration is 1 m/s².

i) Constant speed $Fe_1 = Y_P \times \varepsilon_{Pd} \times M_P + Y_Y \times \varepsilon_{Yd} \times M_Y = 1 \cdot 7.6 \cdot 20 \cdot 9.8 \cdot 0.15 + 0.5 \cdot 7.6 \cdot 20 \cdot 9.8 \cdot 0.1 = 298$ N

ii) Accelerating $Fe_2 = Y_P \times \varepsilon_{Pd} \times M_P + Y_Y \times \varepsilon_{Yd} \times M_Y = 1 \cdot 7.6 \cdot 20 \cdot (9.8 + 0.15) \cdot 0.15 + 0.5 \cdot 7.6 \cdot 20 \cdot (9.8 + 1.0) \cdot 0.1 = 329$ N

iii) Decelerating $Fe_3 = Y_P \times \varepsilon_{Pd} \times M_P + Y_Y \times \varepsilon_{Yd} \times M_Y = 1 \cdot 7.6 \cdot 20 \cdot (9.8 - 1.0) \cdot 0.15 + 0.5 \cdot 7.6 \cdot 20 \cdot (9.8 - 1.0) \cdot 0.1 = 268$ N

Mean effective load Fm

$$Fm = \sqrt[3]{\frac{1}{L}\left(Fe_1^3 \cdot L_1 + Fe_2^3 \cdot L_2 + Fe_3^3 \cdot L_3\right)}$$

$$= \sqrt[3]{\frac{1}{600}\left(298^3 \cdot 350 + 329^3 \cdot 125 + 268^3 \cdot 125\right)}$$

$$= 300 \text{ N}$$

$$L = L_a \times \left(\frac{C}{f_w \cdot F_m}\right)^3$$

$$= 10 \times \left(\frac{24400}{1.2 \cdot 300}\right)^3$$

$$= 3.11 \times 10^6 \text{ km}$$

3-1-2. Static safety factor; Divide the basic static load rating by the maximum load.

$$F_S = \frac{C_0}{Fe} = \frac{C_0}{Fe_2} = \frac{22800}{329} = 69.3$$

3-2. Ball screw
3-2-1. Fatigue life; Obtain the axial load of each stage of operation referring to the operation profile, then calculate the mean load.

i) Constant speed
$Fe_1 = W \cdot g = 20 \cdot 9.8 = 196$ N

ii) Accelerating
$Fe_2 = Fe_1 + W \cdot \alpha = 196 + 20 \cdot 1 = 216$ N

iii) Decelerating
$Fe_3 = Fe_1 - W \cdot \alpha = 196 - 20 \cdot 1 = 176$ N

Axial mean effective load *Fm*

$$Fm = \sqrt[3]{\frac{1}{L}\left(Fe_1^3 \cdot L_1 + Fe_2^3 \cdot L_2 + Fe_3^3 \cdot L_3\right)}$$

$$= \sqrt[3]{\frac{1}{600}\left(196^3 \cdot 350 + 216^3 \cdot 125 + 176^3 \cdot 125\right)}$$

$$= 197 \text{ N}$$

$$L = \ell \times \left(\frac{C_a}{f_w \cdot F_m}\right)^3 \times 10^6$$

$$= 10 \times \left(\frac{7060}{1.2 \cdot 197}\right)^3 \times 10^6$$

$$= 2.66 \times 10^5 \text{ km}$$

3-2-2. Static safety factor; Divide the basic static load rating by the maximum axial load.

$$F_S = \frac{C_{0a}}{Fe} = \frac{C_{0a}}{Fe_2} = \frac{12700}{216} = 58.7$$

3-3. Support unit

3-3-1. Fatigue life; Use the axial load Fm = 197 N, that is the result of above calculation 3-2-1.

$$L = \ell \times \left(\frac{C_a}{fw \cdot Fm}\right)^3 \times 10^6 = 10 \times \left(\frac{7100}{1.2 \times 197}\right)^3 \times 10^6$$

$$= 2.70 \times 10^5 \text{ km}$$

3-3-2. Static safety factor; Divide the limit load by the maximum axial load.

$$F_S = \frac{C_{0a}}{Fe} = \frac{C_{0a}}{Fe_2} = \frac{3040}{216} = 14.0$$

3-4. Result

MCM08068H10D00	Linear guide	Ball screw	Support unit

C-1-5 Maintenance

C-1-5.1 Maintenance Method

1. For standard Monocarrier, we pack grease in the slider, linear guides and ball screw.
2. Monocarriers are equipped with NSK K1 Lubrication Unit as a standard feature, therefore, you may use it for 5 years or 10 000 km depending on your application, whichever comes first, without maintenance. However replenishment of preceded grease may extend its life substantially.
3. The NSK K1 Lubrication Unit is ideal in environments where oily dust exists. However, the life may be shorter than described in Clause 2 above. In such a case, it requires increasing the frequency of replenishment.
4. A Nozzle for the NSK grease gun for MCH Monocarriers is available as an option. NSK reference number: NSK HGP NZ8

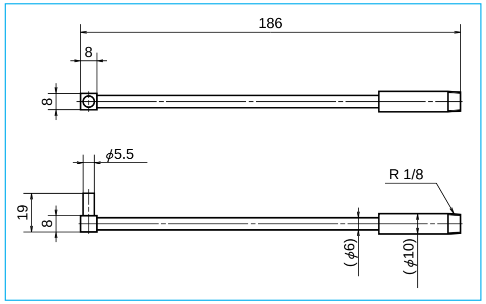

Fig. 5.1 NSK HGP NZ8

Precautions for handling

1. Please consult with NSK when the motor is coupled to the ball screw using a pulley because there is a restriction on allowable load to the end of ball screw shaft.
2. To extend high performance of NSK K1 lubrication unit, please observe the following.

1. Temperature range	Ambient temperature: 50˚C Max. instantaneous temperature: 80˚C
2. Use of chemicals	Never leave a Monocarrier in close proximity of grease removing organic solvents such as hexane or thinner. Never immerse it in an antirust solvent that contains kerosene.

Note: Other oils, such as water-based and oil based cutting oil, and grease do not cause any problems.

C-1-5. 2 NSK K1™ Lubricant Unit

NSK K1 lubrication unit exhibits outstanding features, confirmed by abundant experimental data, along with proven performance of linear guides and ball screws that are equipped with NSK K1.

(1) High-Speed Durability Test of Linear Guides without Lubricant

Results of high-speed durability testing of a linear guide without lubricant are shown in Fig. 5.2. While the linear guide cannot be operated without lubricant for even short periods without damage, the installation of the NSK K1 permits the linear guide to run over 25 000 km without any problem.

Conditions	Test piece: LH30AN (Preload Z1)
	Speed: 3.3 m/s
	Stroke: 1800 mm
No lubricant	All grease removed
NSK K1	All grease removed + NSK K1

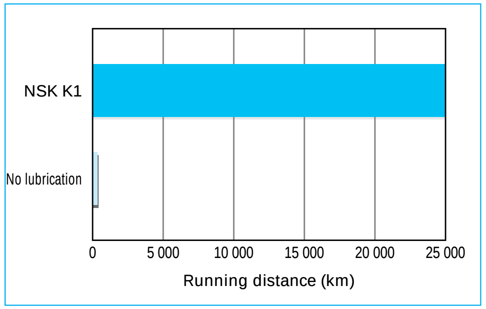

Fig. 5.2 Results of high-speed durability test of linear guides without lubricant

(2) High-Speed Durability Test of Ball Screws without Lubricant

Results of high-speed durability testing of ball screw without lubrication are shown in Fig.5.3. While the ball screw cannot be operated without a lubricant at 8.5 km without damage, the installation of the NSK K1 permits the ball screw to run over 21 000 km without any problem.

Conditions	Test piece: BS2020 (ball screw)
	Shaft diameter: 20 mm
	Lead: 20 mm
	Load: none
	Speed: 1.3 m/s (4 000 min^{-1})
	Stroke: 600 mm

●NSK K1 Lubrication Units for food processing and medical devices are available.

For safety equipment of food processing and medical care, NSK provides the Monocarrier equipped with special NSK K1 Lubrication Unit that is made of materials approved by the FDA. Dimensions are the same as the standard NSK K1 Lubrication Unit, and special handling care is not required.

C 18

C-1-6 NSK Clean Grease LG2 Specification

● **Features**

This grease was developed by NSK to be exclusively used for linear guides and ball screws in clean rooms. Compared to the fluoride grease which are commonly used in clean rooms, LG2 has several advantages such as: higher in lubrication function, longer lubrication life, more stable torque (resistant to wear), and higher rust prevention.

In dust generation, LG2 is more than equal to fluoride grease in keeping dust volume low. Since the base oil is not a special oil but a mineral oil, LG2 can be handled in the same manner as general grease.

● **Applications**

LG2 is lubrication grease for rolling contact machine components such as linear guides and ball screws for processing equipment for semiconductors and LCD which require highly clean environment at normal pressure in normal temperatures. It cannot be used in a vacuum environment.

● **Nature**

Thickener	Lithium soap base
Base oil	Mineral oil + Synthetic hydrocarbon oil
Consistency	207
Dropping point	200°C
Volume of evaporation	1.40% (99°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	0.8% (100°C, 24 hr)
Base oil kinematic Viscosity	30 mm²/s (40°C)

C-1-7 Characteristics and Evaluation Method

C-1-7. 1 Positioning Accuracy

Perform successive positioning from the reference position in a specific direction. Measure the difference between the actual and desired travel distances for each point from the reference position. Repeat this measurement seven times to determine the average value. Measure such average value over the entire travel distance at the intervals specified for each model and take the maximum difference of the average values determined at respective positions as the measured value.

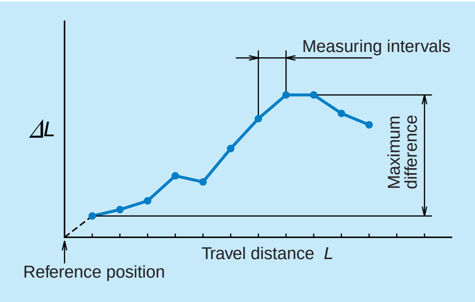

Fig. 7.1

C-1-7. 2 Repeatability

Repeat positioning at any point seven times from the same direction to measure the stopping position and determine one half of the maximum difference of readings. Repeat this measurement over the entire travel distance at the intervals specified for each model. Take the maximum difference of the determined values as the measured value. Express one half of the maximum difference with a plus-or-minus (±) sign.

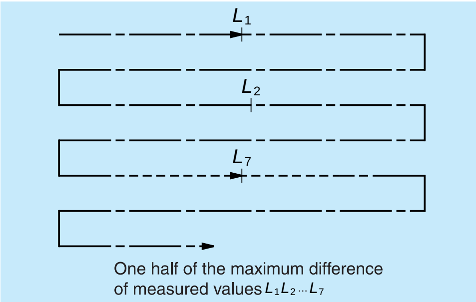

Fig. 7.2

C-1-7. 3 Running Parallelism (Vertical direction)

We specify the parallelism of slider to the datum bottom face of rail. An indicator is fixed on the slider making its stylus slightly touching on the rail bottom surface. The slider is moved in the axial direction for the checking. We define the total indicator reading as the running parallelism. During the checking, the rail is not fixed to the table base. Please be aware that, in general application, the rail is fixed to the machine base, and thus the wobbly rolling error will be added to the running parallelism.

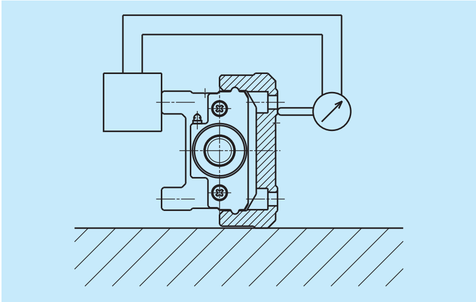

Fig. 7.3 Setting of indicator

C-1-8 Special Specifications

Please consult NSK if your requirement is not in the standard products.

(1) Surface Treatment

• Fluoride low temperature chrome plating

Note: Ball screw parts (including low temperature chrome plating.)

(2) Special Machining (Processing)

①Shaft end processing

• Key way processing

• One flat or two flats processing

②Pin hole processing

• Slider

• Rail

Note: Due to interference with the internal construction, the position of pin hole is limited. Please consult NSK for the pin position.

(3) Motor Bracket and Intermediate Plate for Motor Mounting

• We provide motor mounting brackets and intermediate plates that are not listed in the catalog.

• We assemble motor upon request, if the motor is provided in advance.

Note: Motion check of the motor is unavailable.

(4) Reversed Motor Mount

The reversed motor mount is available. Please consult NSK.

Notes: 1) We don't check motor running condition.

2) Please refer to the bottom of page C77 to 79 for the configuration of reversed motor mounting of the MCH series.

(5) Right and Left Turn Thread

Right and left turn ball screw is available. Please consult NSK for available leads.

(6) Ball-Screw-Less Specification (Only Linear Guide Part)

A ball-screw-less rail part with the same cross section of standard Monocarriers is available for a driven linear guide. It will lessen a height adjustment work compared with a construction with two standard Monocarriers.

Note: Height grinding adjustment of the two axes assembly is not available.

∗When a sensor unit is used, the full-cover unit cannot be used. Not include height such as screw

Note: The dimensions of cover shown above do not include the head height of fixing machine screws. Add the head of machine screws of approximately 2.5 mm to the outer measurement of a cover unit. Set a margin for mechanical interference with surrounding components.

C-3 MCH Series

C-3-1 MCH Series Reference Number Coding

[Body]

※1

Reference number : MC H 06 040 H 10 K (B 0)

- MC: Monocarrier
- H: H Type: MCH Series; L Type: MCH Series low profile rail (only for 06 size)
- 06: Nominal size (rail width, Unit: 10mm)
- 040: Stroke (Unit: 10mm)
- H: Accuracy grade (H, High grade; P, Precision grade).
- 10: Ball screw lead (mm)
- K: Slider specification K: Single slider (See page C10) D: Double slider
- B: Grease specification: B (LG2)(See page C19)
- 0: Special specification

※1 : These two code fields shall be added when non-standard grease is used. The coding of an MCH Monocarrier with standard grease shall have 12 characters as shown above.

[With Option part]

Reference number : MC S 06 040 H 10 K 0 0 K 0 0 0

- S: S : With MCH optional components; R : With MCL optional components
- K: NSK management number
- 0: Sensor unit
- 0: Cover unit
- 0: Intermediate plate for motor bracket

Note : Optional components are available separately.

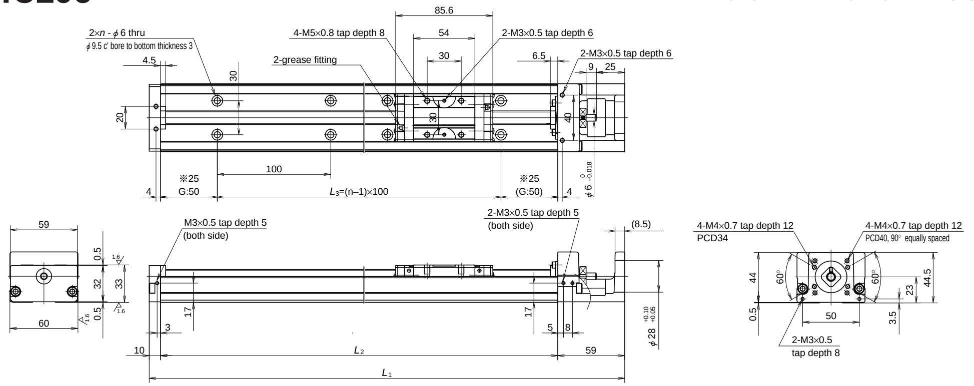
C-3-2 MCH Series Dimension Table of Standard Products

MCL06 Accuracy grade: High grade (H)



●The rail of MCL 06 is made lighter than that of MCH 06 by lowering the rail height. The weight ratio between the MCH 06 and MCL 06 is 5 to 4.

●Double slider specification is also available for the MCL 06.

●Combinations of stroke and ball screw lead of the MCL 06 are the same as those of the MCH 06.

1.2 Lubrication and Materials

1. Lubrication

Grease can be used for high rotation and magnetic field. However, grease evaporates or solidifies in special environment such as vacuum, high temperature, and low temperature. Solid lubricant is used when it is difficult to use grease. Functions of solid lubricant differ greatly by condition where it is used. It is important to select the most suitable solid lubrication for the environment.

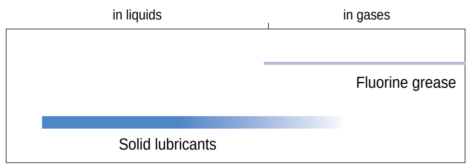

Fig. 2.4 Lubrication in high temperature

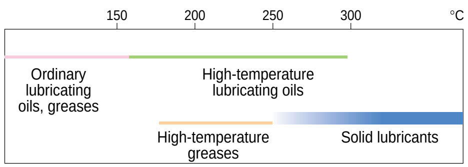

Fig. 2.5 Lubrication in low temperature

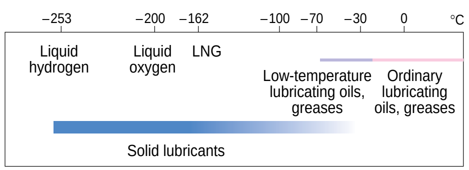

Fig. 2.6 Lubrication in radioactive environment

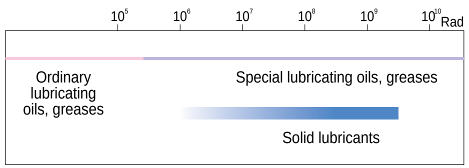

Fig. 2.7 Temperature range for using solid lubricants

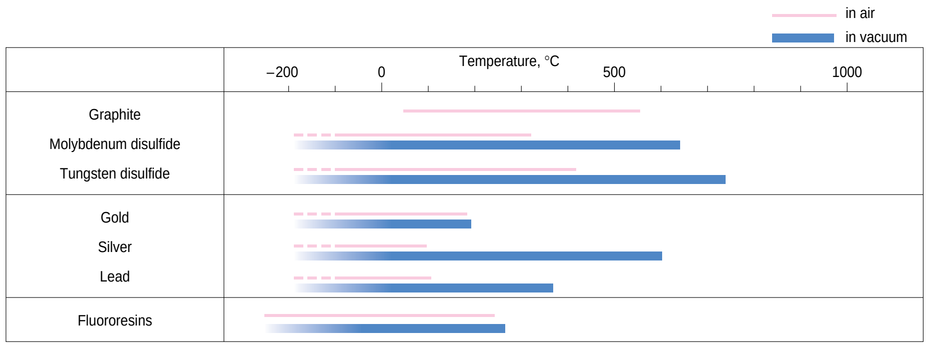

2. Materials

Iron type metals are used in vacuum, high temperature, and high speed environments as the basic material. We generally use nonmagnetic stainless steel for nonmagnetic materials.

Table 2.1 Characteristics of metal materials

Application	Type of steel	Linear expansivity $\times 10^{-6}$/°C	Young's modulus GPa	Hardness (1) HB
For clean environment, vacuum environment, corrosion resistance, low temperature, high temperature, radioactive resistance	Martensitic stainless steel SUS440C	10.1	200	580
	Austenitic stainless steel SUS304	16.3	193	150
	Precipitation hardening stainless steel SUS630	10.8	200	277 – 363
Nonmagnetic	Nonmagnetic stainless steel	17.0	195	420

Note (1) Hardness of steel is usually indicated by Rockwell C Scale. For comparison, these figures are expressed by Brinell number.

1.3 Rust Prevention and Surface Treatment

1. Fluoride low temperature chrome plating

The use environment of NSK linear guides and ball screws is expanding from general industrial machines, semiconductor and liquid crystal manufacturing systems to aerospace equipment.
Among all measures to cope with environment, rust prevention is the most challenging. Such environment includes: Moisture for washers and other equipment; Chemicals used in the wet processing of semiconductor and liquid crystal display manufacturing equipment.
NSK developed electrolytic rust prevention black film treatment (black chrome plating) which is added by fluoro resin impregnating treatment. (hereinafter referred as "Fluoride low temperature chrome plating") This surface treatment methods has proved its superiority as the rust prevention of linear guides and ball screws which are used in above equipment.

● What is "Fluoride low temperature chrome plating ?"

This is a type of black chrome plating which forms a black film (1 to 2 μm) on the metal surface. Fluoroplastic coating is added to the film to increase corrosion resistance.

- Accuracy control is easily manageable due to low temperature treatment and to an absence of hydrogen embrittlement.
- Product accuracy is less affected due to the thin film which has high corrosion resistance.
- This method is superior to other surface treatments in durability on the rolling surface.
- Inexpensive compared with products by other surface treatment and stainless steel products.

Do not use organic solvent because it adversely affects antirust property of the plating.

● Humidity cabinet corrosion resistance test

1.4 Measures Against Special Environments

1. In vacuum

● Silver-film plated ball screw

Ball screws that are plated by soft metal (special silver film) as a solid lubricant are developed the application for vacuum environment such as semiconductor manufacturing equipment and surface modification systems.

● Durability test in high vacuum

Test equipment and conditions

Table 4.1 shows ball screw specifications. Figure 4.1 is a schematic of the testing system in vacuum chamber. Table 4.2 shows testing conditions.

Evaluation method

It is understood that the rolling bearing with solid lubrication reaches end of life when the lubrication film deteriorates, resulting in sudden rise of friction torque. In this test, ball screw rotation torque was constantly measured to study durability and operation. Results were then evaluated.

Test results

Fig. 4.2 shows two distinctive examples obtained in the torque characteristic test.

Photo 4.1 Vacuum testing system

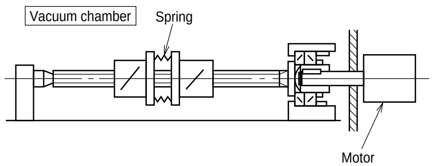

Fig. 4.1 Schematic of the testing system

Test results of the ball screw ①

The torque tendency was stable until about 1 x 10^7 rev. Then the torque characteristics slightly deteriorated. At about 1.35 x 10^7 rev, the torque suddenly rose. At this point, it was determined that the ball screw reached the end of its life.

Test results of the ball screw ②

Torque value is a little higher in the test ①. The value is also little unstable. The torque momentarily soared several times during the test (some 10N • cm). It is thought this is attributable to the repeated peeling/sticking of the surface film made of soft metal (silver, etc.).

When the torque finally soared at 1.13 x 10^7 rev., it was determined that the ball screw reached the end of its life.

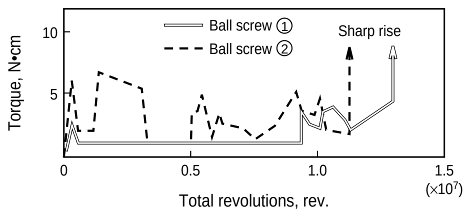

Fig. 4.2 Torque variation

Table 4.3 Ball screw durability

Classification		Ball screw ①	Ball screw ②
Life	Total revolutions (rev.)	1.35×10^7	1.13×10^7
	Total traveling distance (km)	54.0	45.2
	Total traveling hours[1] (h)	750	628

Note: (1) Total traveling hours when operated constantly at 300 min^{-1}

Conclusion

Table 4.3 explains results of the two ball screw durability tests.

From these results and other findings, it is estimated that a life of more than 1 × 10^7 rev. is possible with a load of about 29.4 N.

Torque may soar momentarily before the ball screw reaches its final life due to peeling/sticking of the surface film made of soft metal like silver. For this reason, it is recommendable to select a drive motor with extra torque capacity.

2. Clean environment

● NSK Clean Grease LG2, LGU

NSK Clean Grease LG2 is used in clean room for NSK linear guides, ball screws, Monocarriers, Robot Modules, Megathrust motors, XY tables, etc. with low-dust emitting specifications. For its low dust emission and high durability, LG2 earns trust and high reputation of semiconductor equipment manufacturers.

LG2 is superior in many areas to fluorine greases which are commonly used in clean room.

Features

- **● Remarkably low dust emission**
- **● Long life -- More than ten times longer than fluoride greases, and equivalent to ordinary greases.**
- **● Excellent rust prevention -- Significantly higher capacity than fluorine greases.**
- **● Low and stable torque -- 20% or less than that of fluorine greases**

Table 4.4 Nature of Clean Grease LG2

Name	Thickener	Base oil	Base oil kinematic viscosity mm²/s (40°C)	Consistency	Dropping point °C
Clean Grease LG2	Lithium soap	Synthetic hydrocarbon oil + mineral oil	30	207	200
Clean Grease LGU	Diurea	Synthetic hydrocarbon oil	100	209	260

● Feature 2 : Long life

Life is ten times or longer than fluorine greases, and equivalent to ordinary greases. This stretches maintenance intervals.

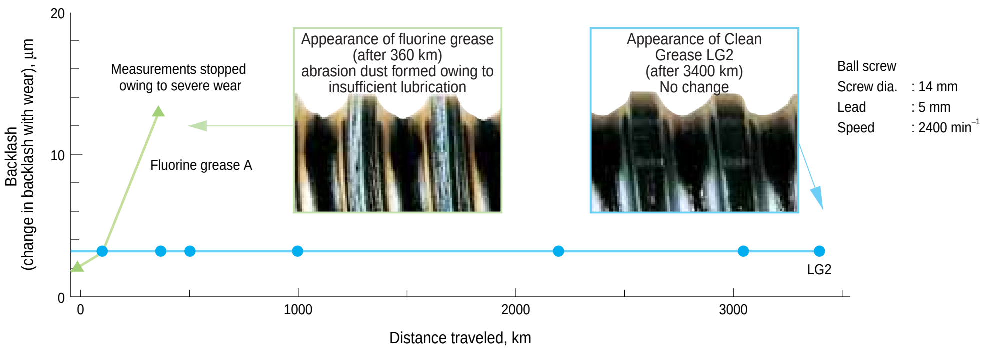

Fig. 4.6 Results of ball screw durability test

●Feature 3 : Excellent rust prevention capacity

The rust prevention capacity is significantly higher than fluoride type greases. Handling and preparation for operation are easy.

3. Environment with foreign matters

● NSK K1 lubrication unit (linear guide and ball screw)

Molded oil is made of a lubrication oil and polyolefin which has affinity with the lubrication oil. More than 70% of the mass is lubrication oil.
Molded oil which is formed into NSK K1 lubrication unit effectively seals linear guides, continually supplying lubrication oil. NSK K1 lubrication unit has made it possible to use linear guides in water or powder dust.
NSK K1 lubrication unit is available for ball screws.

Features

- **Extend maintenance-free intervals**
- **No contamination of surrounding environment**
- **Prolong life of the products exposed to water**

Refer to Page A38 and B209 for details of NSK K1 lubrication unit.

1.6 Precautions for Handling

Please observe the following precautions to maintain high functions of ball screws and linear motion guide bearings in special environment over a long period.

- Products are washed to remove oil, and wrapped in a way to protect them from moisture. Use the product as soon as possible after opening the package.
- After opening, store the ball slide (interchangeable type linear guide) and ball nut (rolled ball screw) in a clean, air-tight container such as desiccater with desiccating agent (e.g. silica gel). Do not apply rust preventive oil or paper or product that vaporizes rust preventive agent.
- Wear plastic gloves and handle product in clean place.

2. Lubrication

There are two types of lubricating method -- grease and oil -- for ball screws and linear guides.
Use a lubricant agent and method most suitable to condition requirements and purpose to optimize functions of the ball screws and linear guides.
In general, lubricants with low base oil kinematic viscosity are used for high speed operation, in which thermal expansion has large impact, and in low temperatures.
Lubrication with high base oil kinematic viscosity is used for oscillating operations, low speed and high temperature.
The following are lubrication methods by grease and by oil.

2.1 Grease Lubrication

Grease lubrication is widely used because it does not require special oil supply system or piping. Grease lubricants made by NSK are:
- Various types of grease in bellowed container which can be instantly attached to the grease pump;
- NSK Grease Unit which comprise a hand grease pump and various nozzles. They are compact and easy to use.

1. NSK grease lubricants

Table 1.1 shows the marketed general grease widely used for linear guides and ball screws, in specific uses, conditions and purposes.

Table 1.1 Grease lubricant for linear guides and ball screws

Type	Thickener	Base oil	Base oil kinematic viscosity mm²/s (40°C)	Range of use temperature (°C)	Purpose
AS2	Lithium type	Mineral oil	130	– 10 – 110	For ball screws and linear guides for general use at high load.
PS2	Lithium type	Synthetic oil + mineral oil	15	– 50 – 110	For ball screws and linear guides for low temperature and high frequency operation.
LR3	Lithium type	Synthetic oil	30	– 30 – 130	For ball screws at high speed, medium load.
LG2	Lithium type	Synthetic oil + synthetic hydrocarbon oil	30	– 20 – 70	For ball screws and linear guides for clean environment.
LGU	Diurea	Synthetic hydrocarbon oil	100	– 30 – 120	For ball screws and linear guides for clean environment.
NF2	Urea composite type	Synthetic oil + mineral oil	27	– 40 – 100	For fretting resistant ball screws and linear guides.

(1) NSK Grease AS2

● Features
It is an environmentally friendly and widely used grease for high load application. It is mineral oil based grease containing lithium thickener and several additives. It is superb in load resistance as well as stability in oxidization. It not only maintains good lubrication over a long period of time, but also demonstrates superb capability in retaining water. Even containing a large amount of water, it does not lose grease when it is softened.

● Application
It is a standard grease for general NSK linear guides and ball screws. It is prevalently used in many applications because of its high base oil viscosity, high load resistance, and stability in oxidization. The AS2 has replaced the AV2 grease as the standard grease.

● Nature

Thickener	Lithium soap base
Base oil	Mineral oil
Consistency	275
Dropping point	185°C
Volume of evaporation	0.24% (99°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	2.8% (100°C, 24 hr)
Base oil kinematic viscosity	130 mm²/s (40°C)

(2) NSK Grease PS2

● Features
The major base oil component is synthetic oil with mineral oil. It is an excellent lubrication especially for low temperature operation. It is for high speed and light load.

● Application
It is a standard grease for NSK miniature linear guides and ball screws. It is especially superb for low temperature operation, but also functions well in normal temperatures, making it ideal for small equipment with light load.
(Previous reference number is NSK Grease No.2)

● Nature

Thickener	Lithium soap base
Base oil	Synthetic oil + mineral oil
Consistency	275
Dropping point	190°C
Volume of evaporation	0.60% (99°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	3.6% (100°C, 24 hr)
Base oil kinematic viscosity	15 mm²/s (40°C)

(3) NSK Grease LR3

● Features
It contains a special synthetic oil for high temperature and stability, and a carefully selected anti-oxidation agent. This grease dramatically increases lubrication life under high temperature conditions. It is used for high speed, medium load. Lubrication life exceeded 2000 hours in the endurance test at 150°C. Its rust prevention capacity in severe conditions such as water and moist environments is further strengthened.

● Application
It is a standard grease for NSK standard linear guides and ball screws in finished shaft end FA Type. It is ideal for operation with medium load, at high speed such as positioning in high tact material handling equipment.
(Previous reference number is NSK Grease No.1)

● Nature

Thickener	Lithium soap base
Base oil	Mineral oil
Consistency	227
Dropping point	208°C
Volume of evaporation	0.30% (99°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	1.9% (100°C, 24 hr)
Base oil kinematic viscosity	30 mm²/s (40°C)

(4) NSK Grease LG2

● **Features**

This grease was developed by NSK to be exclusively used for linear guides and ball screws in clean room. Compared to the fluorine grease which are commonly used in clean room, LG2 has several advantages such as:

- Higher in lubrication function
- Longer lubrication life
- More stable torque (resistant to wear)
- Higher rust prevention.

In dust generation, LG2 is more than equal to fluorine grease in keeping dust volume low. Since the base oil is not a special oil but a mineral oil, LG2 can be handled in the same manner as general greases.

● **Application**

LG2 is a lubrication grease for rolling element products such as linear guides and ball screws for semiconductor and liquid crystal display (LCD) processing equipment which require a highly clean environment. Because LG2 is exclusively for a clean environment at normal temperatures, however, it cannot be used in a vacuum environment.

Refer to "Special environment" in Page D8 for detailed data on superb characteristics of NSK Grease LG2.

● **Nature**

Thickener	Lithium soap base
Base oil	Mineral oil + Synthetic hydrocarbon oil
Consistency	207
Dropping point	200°C
Volume of evaporation	1.40% (99°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	0.8% (100°C, 24 hr)
Base oil kinematic viscosity	30 mm²/s (40°C)

(5) NSK Grease LGU

● **Features**

This is a proprietary urea base grease of NSK featuring low dust emission exclusively for ball screws and linear guides which are used in clean rooms.

In comparison with fluorine base grease, which has been used commonly in clean rooms, LGU has better lubricating property, longer duration of lubricant, better torque variation, much better anti-rust property, and equivalent or better dust emission. In addition, this grease can be handled in the same way as the other common grease because high-grade synthetic oil is used as the base oil.

LGU grease contains much less metallic elements compared to LG2 grease. It can be used in high temperature environment.

● **Application**

This is exclusive lubrication grease for ball screws and linear guides that are installed in equipment that requires cleanliness, as same as LG2 grease, and it can be used in high temperature range of –30° to 180°C.

This cannot be used in vacuum.

● **Nature**

Thickener	Diurea
Base oil	Synthetic hydrocarbon oil
Consistency	209
Dropping point	260°C
Volume of evaporation	0.09% (99°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	0.6% (100°C, 24 hr)
Base oil kinematic viscosity	100 mm²/s (40°C)

(6) NSK Grease NF2

● **Features**

It uses high-grade synthetic oil as the base oil and urea base organic compound as the thickener. It has remarkable anti-fretting corrosion property. It can be used in wide temperature range, from low to high, and has superior lubrication life.

● **Application**

This grease is suitable for ball screws and linear guides of which application include oscillating operations. Allowable temperature range is –40° to 130°C.

● **Nature**

Thickener	Diurea
Base oil	Synthetic hydrocarbon oil
Consistency	288
Dropping point	269°C
Volume of evaporation	7.9% (177°C, 22 hr)
Copper plate corrosion test	Satisfactory (Method B, 100°C, 24 hr)
Oil separation	0.6% (100°C, 24 hr)
Base oil kinematic viscosity	27 mm²/s (40°C)

● **Precautions for handling**

- Wash the linear guides and ball screws to remove oil prior to applying Clean Grease LG2 or LGU, so the grease functions are fully utilized.
- Clean grease is exclusively used for clean environments at normal temperatures.

2. How to replenish grease

Use grease fitting to linear guide ball slide or to ball screw nut if exclusive grease supply component is not used. Supply required amount to grease fitting by a grease gun (pump).

Wipe off old grease and accumulated dust before supplying new grease. If grease fitting is not used, apply grease directly to the rail or to the ball groove of the screw shaft. Remove the seal if possible, and move a ball slide or ball nut few strokes so the grease permeates into the ball slide and inside the nut. A hand grease pump, an exclusive and easy lubrication device to linear guides and ball screws, is available at NSK.

3. Volume of grease to be replenished

Once grease is replenished, another supply is not required for a long period of time. But under some operational conditions, it is necessary to periodically replenish grease. The following are replenishing methods.

* When there is an exclusive grease supply system and the volume from the spout can be controlled, the criterion is:

- All at once, replenish the amount which fills about 50% of the internal space of the ball slide, or the internal space of the ball nut. This method eliminates waste of grease, and is efficient.

Tables 1.2 and 1.3 show internal spaces of ball slide and ball nut for reference.

* When replenishing using a grease gun:

Use a grease gun and fill the inside of ball slide and the ball nut with grease. Supply grease until it comes out from the ball slide or ball nut area. Move the ball slide or ball nut by hand while filling them with grease, so the grease permeates all areas. Do not operate the machine immediately after replenishing. Always try the system a few times to spread the grease throughout the system and to remove excess grease from inside. Trial operations are necessary because the resistance to sliding force of linear guide and the ball screw torque greatly increase immediately after replenishment (full-pack state) and may cause problems. Grease's agitating resistance is accountable for this phenomenon. Wipe off excess grease that accumulates at the end of the rail and screw shaft after trial runs, so the grease does not scatter to other areas.

4. Intervals of checks and replenishments

Although the grease is of high quality, it gradually deteriorates and its lubrication function diminishes. Also, the grease in the ball slide and ball nut is gradually removed by stroke movement. In some environments, the grease becomes dirty, and foreign objects may enter. New grease should be replenished depending on frequency of use. The following is a guide of intervals of grease replenishments to linear guides and ball screws.

Table 1.4 Intervals of checks and replenishments for grease lubrication

Intervals of checks	Items to check	Intervals of replenishments
3-6 months	Dirt, foreign matters such as cutting chip	Usually once per year. Every 3000 km for material handling system which travels more than 3000 km per year. Replenish if checking results warrant it necessary.

Note: 1) As a general rule, do not mix greases of different brands. Grease structure may be destroyed if greases of different thickeners are mixed. Even when greases have the same thickener, different additives in them may have an adverse effect on each other.

2) Grease viscosity varies by temperature. Viscosity is particular high in winter due to low temperature. Pay attention to increase in linear guide's sliding resistance and ball screw torque in such occasion.

5. NSK Grease Unit

Supply grease to NSK linear guides and ball screws by a manual type hand grease pump. Install the grease in bellows tube to the pump. Several types of grease (80 g) are available.

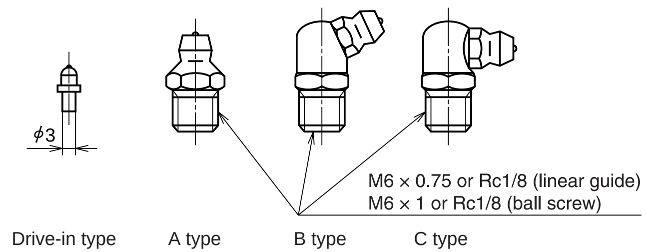

Fig. 3.3 Grease fittings

A long threaded grease fitting is required for NSK linear guides because of dust proof parts. Please refer to the sections pertaining to the lubrication and dust proof parts of each series.

Normally, grease fitting is not provided to NSK ball screw. However, ball nut has a tap hole to install a grease fitting. The user should install a grease fitting if necessary. If there is no tap hole, apply grease directly to the screw shaft and ball grooves.

2.2 Oil Lubrication

Required amount of new oil is regularly supplied by:
- Manual or automatic intermittent supply system;
- Oil mist lubricating system via piping.

Equipment for oil lubrication is more costly than grease lubrication. However, oil mist lubricating system supplies air as well as oil, raising the inner pressure of the ball slide. This prevents foreign matters from entering, and the air cools the system. Use an oil of high atomizing rate such as ISO VG 32 to 68 for the oil mist lubrication system.
ISO VG 68 to 220 are recommended for common intermittent replenishment system. Approximate volume of oil Q for a ball slide of linear guide per hour can be obtained by the following formula.

In case of ball type linear guides except the LA Series

Q = n/150 (cm³/hr)

In case of LA Series, RA Series

$Q \geq$ n/100 (cm³/hr)

n: Linear guide code

e.g. When LH45 is used,

n = 45

Therefore,

Q = 45/150 = 0.3 cm³/hr

Similarly, approximate oil supply volume Q to ball screw can be obtained by the following formula.

$Q = d/15$ (cm³/hr)

d: Nominal shaft diameter of the ball screw

e.g. When the shaft diameter is 50,

d = 50

Therefore,

Q = 50/15 = 3.3 cm³/hr

For oil lubrication by gravity drip, the oil supply position and installation position of the ball slide or ball nut are crucial. In case of linear guide, unless it is installed to a horizontal position, the oil flows only on the down side, and does not spread to all raceway surface. This may cause insufficient lubrication. For ball screw lubrication as well, oil does not spread if the oil orifice is installed at the bottom, causing insufficient lubrication. Please consult NSK to correct such situations prior to use. NSK has internal design which allows oil lubricant to flow throughout the system. Table 2.1 shows the criterion of intervals of oil checks and replenishments.

Table 2.1 Intervals of checks and replenishments

Method	Intervals of checks	Items to check	Replenishment or intervals of changes
Automatic intermittent supply	Weekly	Volume of oil, dirt, etc.	Replenish at each check. Suitable volume for tank capacity.
Oil bath	Daily before operation	Oil surface	Make a suitable criterion based on consumption

Note: 1) As with grease lubrication, do not mix oil lubricant with different types.

2) Some components of the linear guide and ball screw are made of plastic. Avoid using an oil that adversely affects synthetic resin.

3) When using oil mist lubricating system, please confirm an oil supply amount at the each outlet part.

3. RoHS Compliant

1. Linear Guides

· Linear Guides listed in the catalog except the products for special environments, are compliant with RoHS.
· Please consult NSK for RoHS of special parts and lubricant provided by customer, and customer-supplied product.

2. Ball Screws

· Ball screws listed in the catalog except the products for special environments, are compliant with RoHS.

3. Monocarriers

· Monocarriers listed in the catalog are compliant with RoHS.

4. Ball Screw Support Bearings

· Ball screw support bearings listed in the catalog are compliant with RoHS.

*For details of country-specific RoHS, contact NSK.

INSTALLATION OF NSK LINEAR GUIDES™

NSK Ltd.

NSK Linear Guide™: Handling Precautions

NSK linear guides are high quality and are easy to use. NSK places importance on safety in design. For maximum safety, please follow precautions as outlined below.

(1) Lubrication

Confirm lubrication.

a. If your linear guide is rust prevention specification, thoroughly wipe the rust prevention oil, and put lubricant inside of slide before using.
b. If you are using oil as lubricant, the oil may not reach the raceway depending on how the slide is installed. Consult NSK in such case.

(2) Handling

Handle with care.

Do not disassemble.

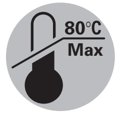
Do not drop.

Do not give impact.

a. Random-matching slides are installed to the provisional rail when they leave the factory. Handle the slide with care during installation to the rail.
b. Do not disassemble the guide unless absolutely necessary. Not only does it allow dust to enter, but it lessens precision.
c. Slide may move by simply leaning the rail. Make sure that the slide does not disengage from the rail.
d. Standard end cap is made of plastic. Beating it or hitting it against an object may cause damage.

(3) Precautions in use

Do not contaminate.



Temperature limitation.

Do not hang upside down.

a. Make every effort not to allow dust and foreign objects to enter.
b. Please apply splash guard or bellows to the linear guide to prevent sticking resolvent or cooland when it contains corrosive material.
c. The temperature of the place where linear guides are used should not exceed 80°C (excluding heat-resistant type linear guides). A higher temperature may damage the plastic end cap.
d. If the user cuts the rail, thoroughly remove burrs and sharp edges on the cut surface.
e. When hanging upside-down (e.g. the rail is installed upside-down on the ceiling in which the slide faces downward), should the end cap be damaged, causing the balls or rollers to fall out, the slide may be detached from the rail and fall. For such use, take measures including installing a safety device.

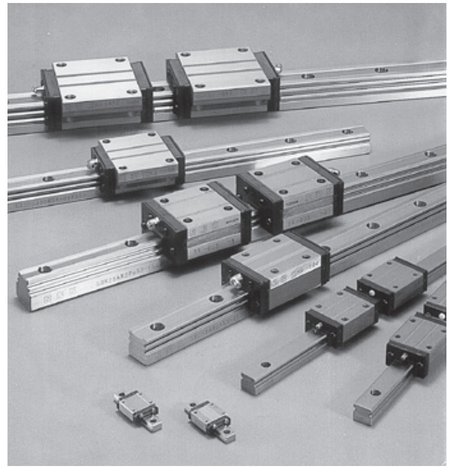
(4) Storage

Store in the correct position.

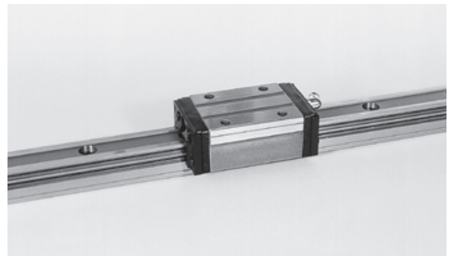
a. Linear guide may bend if the rail is stored in inappropriate position. Place it on a suitable surface, and store it in a flat position.

Installation of NSK Linear Guides™
[No.1 Machine Tools]

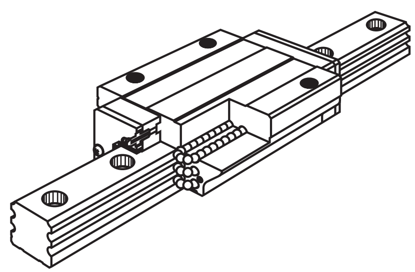
We thank you very much for your patronage of NSK linear guides. This manual describes the procedure for handling of NSK Linear Guides and installation in machine tools with the prescribed accuracy.



We recommend two types of NSK linear guides for the machine tools application. One is RA Series that offers high rigidity, highly reliable durability and high impact load carrying capacity. The other is LA Series that has been widely accepted in the field.

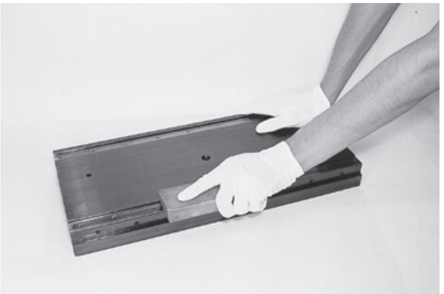


NSK Linear Guides are composed of a rail that governs linear motion of slides, and slides containing recirculating rolling elements that allow smooth movement and retain rigidity of a machine's table or saddle.
Note: Be aware that balls of LA Series fall out a ball slide when it is removed from a rail.



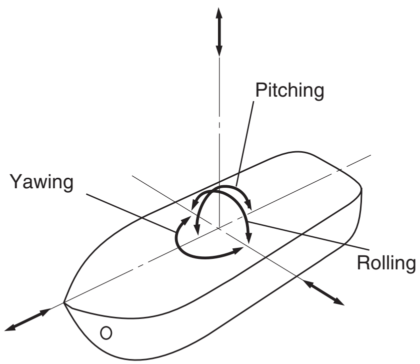
Before installing linear guides for the first time, we recommend a trial installation to gain experience with the procedure. In this trial installation, carefully measure the accuracy of the mounting surfaces on the machine and the accuracy of the linear guides to clarify the relation with the required table accuracy. This will enable you to judge the required accuracy of the machine base and accuracy grade of linear guides, as well as how and what degree you have to measure related accuracy, so that no problems will arise after the machines are finally put into mass production. When installing linear guides for the first time, carefully follow the procedure in this manual.

Remove burrs and roughness on the machine base mounting surfaces with an oil stone or other such stone. Then clean the surfaces with thinner or other volatile fluid.



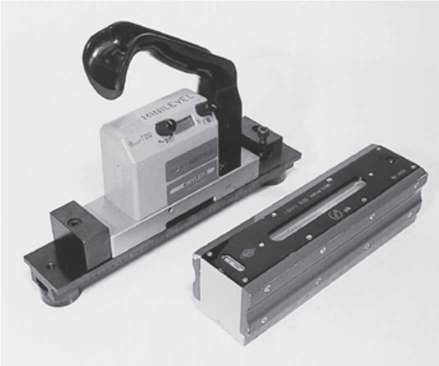
Highly precise measurements of the machine base are necessary; therefore, appropriate instruments in good condition must be used.
Suitable instruments are described next.

The motion of any object can be separated into six "degrees of freedom": three angular movements (pitching, yawing, and rolling) and three linear movements (longitudinal, vertical, and lateral).

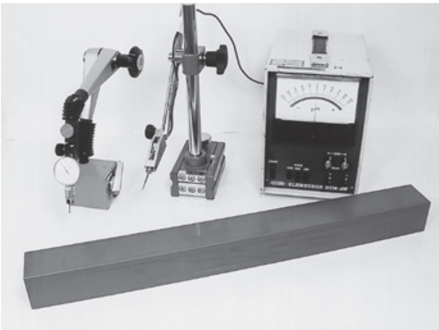


Instruments, which are suitable for only specific measurements, must be maintained and used properly.

Most levels utilize bubbles in a fluid, but some are electric and have a digital indicator. Both types can measure angular wobble in pitching and rolling.

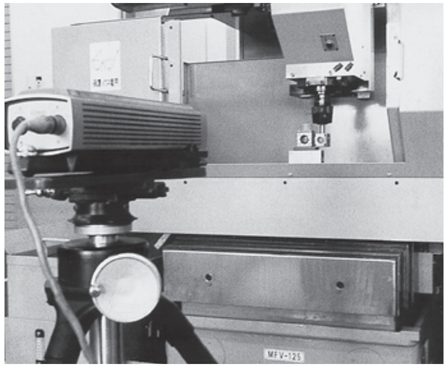


A good straightedge and a dial indicator or an electrical micrometer can be used under the ordinarily conditions to measure pitching, yawing, and rolling as well as vertical and lateral movements.



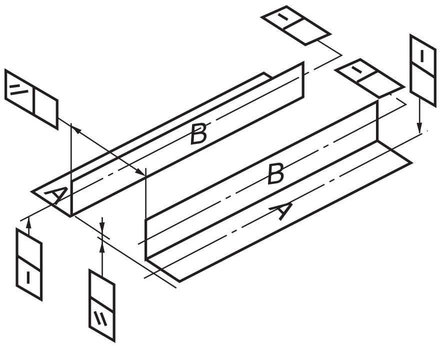
Autocollimators measure angular movement using reflected light, so they can measure pitching and yawing accurately.

Laser interferometer can read pitching, yawing, and linear movement with high accuracy; however, it is not practical since it is hard to handle and requires much time for the setting.

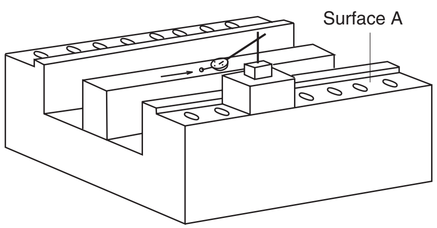


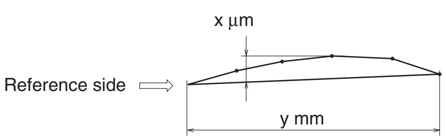
For the purposes of this manual, the combination of a straightedge and a dial indicator was chosen, with an autocollimator and a level used for reference.

The machine base mounting surfaces are designated here as "A" for the rail bottoms and "B" for the rail sides.
The linearity and parallelism of these surfaces are measured in the following manner.

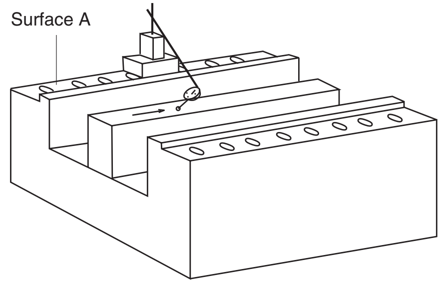


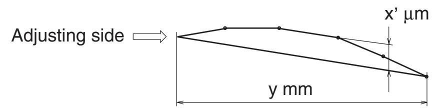
To measure the linearity of each A surface, place a suitable measuring block on one surface and attach a dial indicator to it with its stylus on a straightedge lying parallel to surface A. Holding the block firmly against surface B with both hands, slide the block along surface A for a specified step, record the measurement, then repeat the same to the end of the rail.



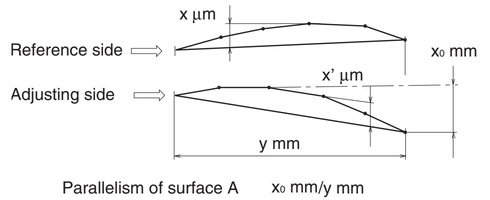


Then repeat the measurements for the other A surface. When doing this, it is important not to move the straightedge.

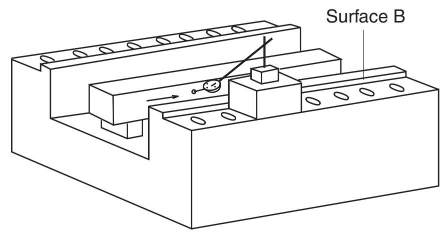


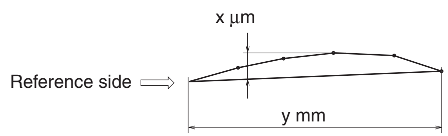


From the measurements of the two A surfaces, determine their parallelism.

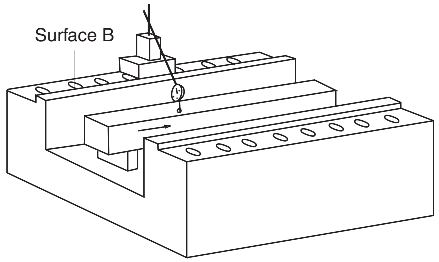


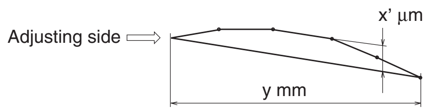
To measure the linearity of the two B surfaces of the machine base, use an arrangement similar to that for the A surfaces but with the dial indicator stylus against the side of the straightedge.



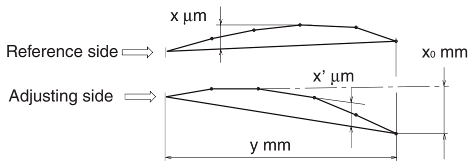


In this case also, the straightedge must not be moved.





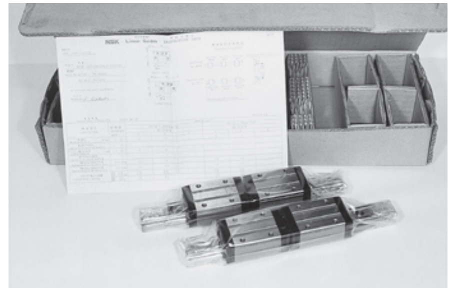
The measurements of the two B surfaces also determine their parallelism.



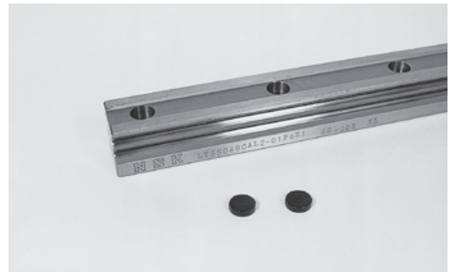
Parallelism of surface B x_0 mm/y mm

The accuracy measurement of the linear guide mounting surfaces is now complete. The linear guides should be carefully installed using the following procedure.

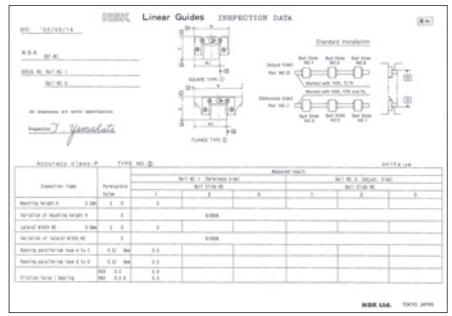
NSK linear guides are packed in corrugated cardboard boxes. Generally we pack the linear guides for machine tools as a pair in the shipping container.
The linear guides are first wrapped in vinyl sheets and placed in their boxes together with an inspection sheet.



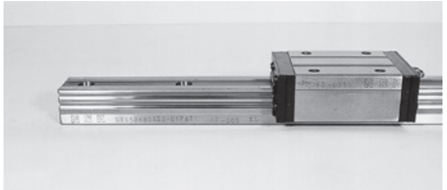
Caps for the rail mounting holes are also included if requested by the customer.



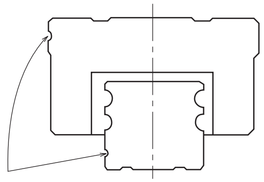
For the P3, P4 and P5 accuracy grades, actual inspection data are listed on the inspection sheets. For the P6 and PN accuracy grades, the inspection certificate are stamped to indicate compliance with the specifications.



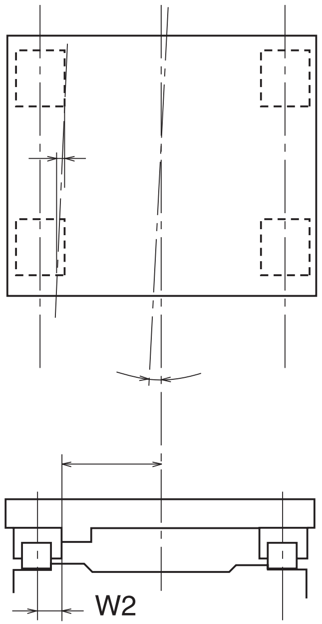
Remove the vinyl wrapping and look for the reference and production numbers on the sides of the rails and slides.



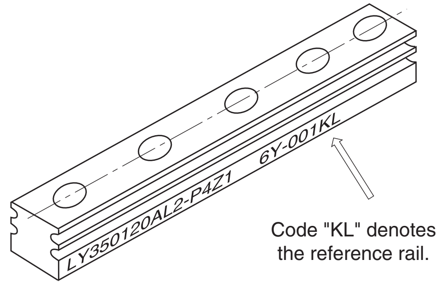
Both rails and all slides are marked with groove mark that designate the datum face.



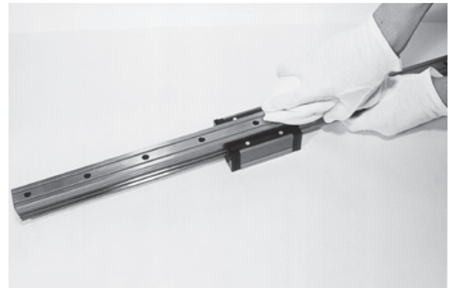
The two rails look similar but one of them is the reference rail that has controlled dimensional variation on the slide datum faces against that of the rail, that mate with corresponding surfaces on the table. If other slides are installed against the table's reference side surface, the table will be skewed as shown by the alternate long and short dash lines in the figure. In the case of two-axis (Cartesian type) tables, accurate squareness of two-axis cannot be obtained.
Generally, no reference side face is provided on the table for the other rail; therefore, the slide face variation is not controlled so closely. This rail is called the "adjusting side rail."



The reference rail is distinguished from the adjusting side rail by the letters KL following the production number on the rail side.

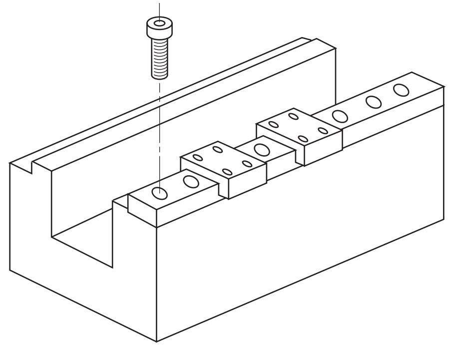


The bottoms of the rails have been coated with rust preventive oil, so wipe it off thoroughly with a clean soft cloth.

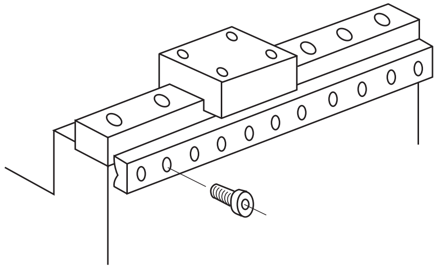


Place a linear guide on the machine base as it is ready for installation.

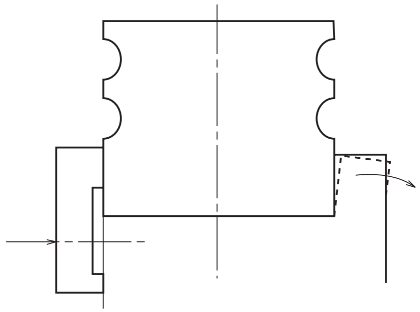
Temporarily tighten its mounting bolts lightly so that the rail's bottom is firmly against the base.



Then install the shoulder plate to press the rail against the opposing surface and tighten the bolts firmly with a wrench. The tightening torque depends on the rigidity of the machine base. In the case of high rigidity, tighten the bolts uniformly with the specified torque.

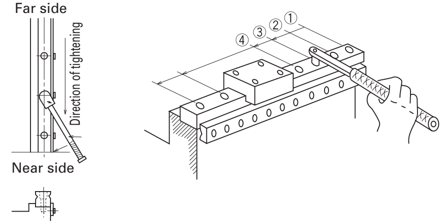


If the machine base is not highly rigid, first tighten temporarily the bolts of shoulder plate so that the rail contacts closely to the datum side surface. Then tighten them again firmly after retightening the rail mounting bolts. Even if there is any bending of NSK linear guide rails, it is a simple curvature and the amount is small, so the bolts do not have to be too tight.



The main purpose of the shoulder plate is to prevent the rail from being disturbed in case of an accident or other troubles. Therefore, tighten the rail mounting bolts firmly and then, tighten the side plate bolts.

In NSK linear guides, the mounting holes are processed after heat treatment using a precision machining center; therefore, the hole pitch accuracy is as good as the positioning accuracy of the machine, which is considered very good.
When installing a linear guide rail against a reference side surface or on a flat surface with no rail shoulder plate, the rail may be slightly bent if the bolts are tightened indiscriminately starting near the middle. NSK recommends that the bolts be tightened starting at one end with the wrench seeing the datum reference side surface of the base on your left as shown in the figure. The rail will be pressed more firmly against the reference side surface if the bolts are tightened in this way.

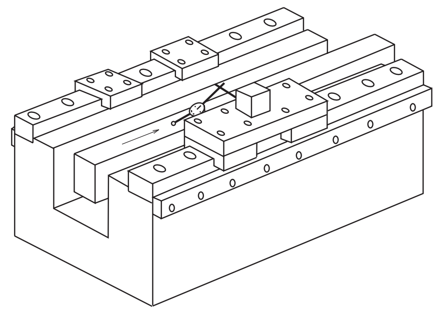


Tightening torque of bolts (Material: Chromium molybdenum steel)

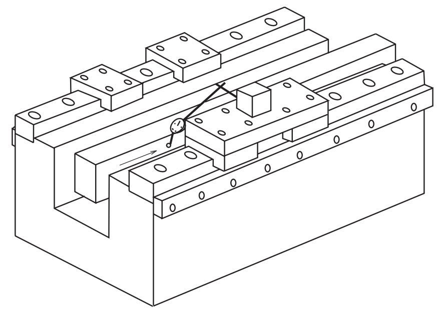
Unit : N • m

Bolt size	Tightening torque	Bolt size	Tightening torque
M2.3	0.38	M10	43
M2.5	0.58	M12	76
M3	1.06	M14	122
M4	2.5	M16	196
M5	5.1	M18	265
M6	8.6	M22	520
M8	22	—	—

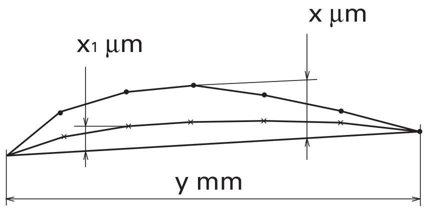
After installing the linear guides as explained above, mount a steel plate on the pair of slides on one rail and measure the pitching by following the same procedure used for inspecting the machine base reference surfaces.



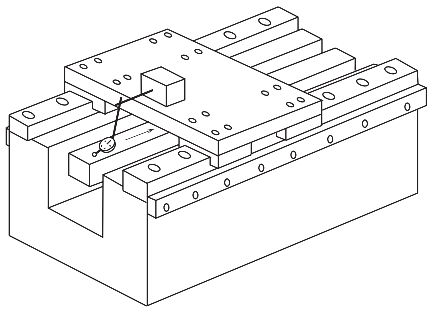
Measure the yawing in the same way and compare the data with that obtained for the machine base reference surfaces to find the variation caused by the installation of the guides.

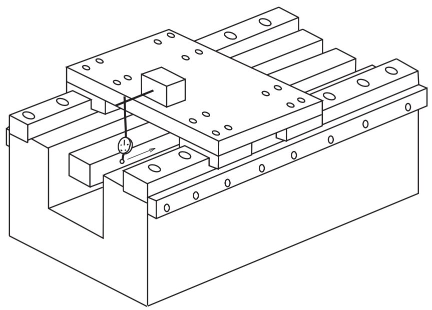


Rails of linear guides will deform to fit the contour of the machine base; i.e., they will become concave if the machine base is concave. If it is not attained, use care when taking measurements since vibration of the machine or floor will cause trouble.

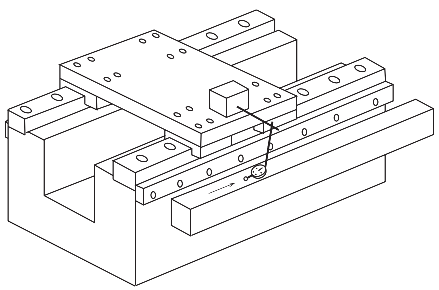


Finally, install the table, saddle, or interim table and check the accuracy of the entire assembly. The linearity of the completed assembly should be better than that for individual slides; however, this depends on the rigidity of the machine and the installing accuracy.
The measurements obtained are important characteristics of each machine built, and are essential data for your installation work instruction at the mass production.

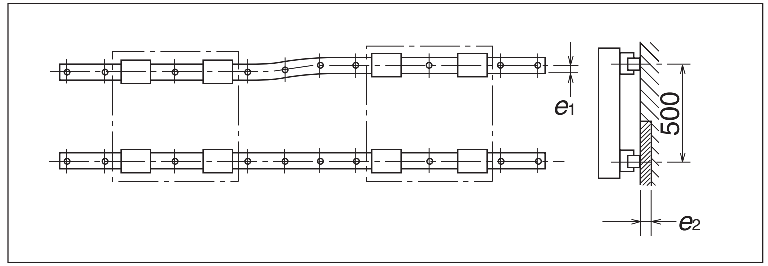




If you removed rust preventive oil or grease from surfaces of the linear guides when installing linear guides, we recommend supplying a rust preventive oil or grease on rail surfaces after installation.



The installation of linear guides is easy if the instructions in this manual are followed carefully. If the accuracy is sufficiently poor to shorten the life of the linear guides, the frictional force will increase, which will serve as a warning. The allowable errors, which are shown below for the LA Series, consist of the error in parallelism (e_1) and error in height (e_2) of the two rails.



Recommended allowable installation error of the LA Series (Maximum) Unit:µm

Item	Preload code	Model number					
		LA25	LA30	LA35	LA45	LA55	LA65
Permissible values of parallelism in two rails e_1	Z3	15	17	20	25	30	40
	Z4	13	15	17	20	25	30
Permissible values of parallelism (height) in two rails e_2	Z3, Z4	185/500mm					

If the errors are smaller than the values in the preceding table, there should be no trouble. Naturally, errors should be as small as possible to achieve the highest performance and reliability of your products.

The procedure for installing linear guides is not too difficult, but care is required. In case of an improper installation, it is necessary to remove them and check all the related parts; however, we hope this will never be necessary. Many machine tool builders install linear guides regularly with no difficulty by following the procedure that is modified to meet their way of chekings based on this manual.

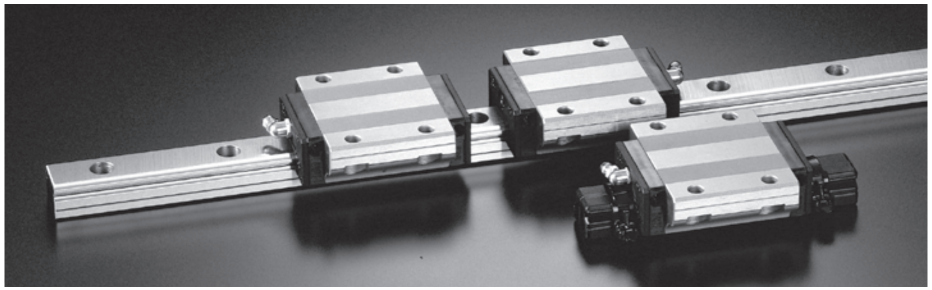
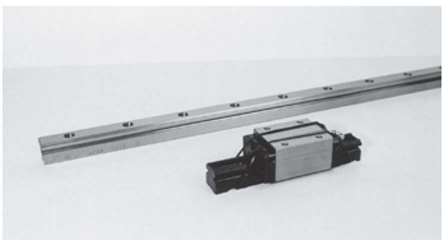
Assembly and Installation of NSK Linear Guides™
(No. 2: General Industrial Machines)

Thank you for choosing NSK linear guides. This manual briefly describes the recommended handling and installation of NSK linear guides for general industrial use.
There are two ways installing the linear guides into general industrial machines. One of them provides a datum shoulder on the mounting base of the machine for accurate horizontal alignment the same as the way for machine tools, while the other is not required a datum shoulder. Refer to “No.1 Machine Tools” for installation procedure that requires a datum shoulder for accurate horizontal alignment. The installation procedure described in this manual assumes that the datum shoulder is not required for horizontal alignment.

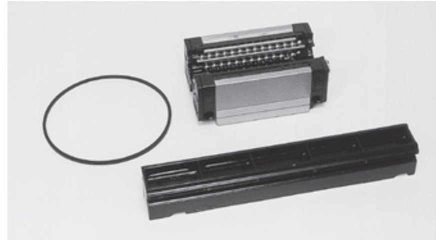
NSK recommends random-matching LH and LS Series linear guides for general industrial application because they feature self-aligning capability better suited to tolerate some misalignment, interchangeability between the rails and ball slides for ease of addition of number of ball slides and their replacement, and standardized stock for short delivery times.



For random-matching LH and LS Series linear guides, the ball slides and the rails are stocked separately. The ball slides are mounted on plastic provisional rails that allows for easy transfer of the ball slide to and from the steel rail.

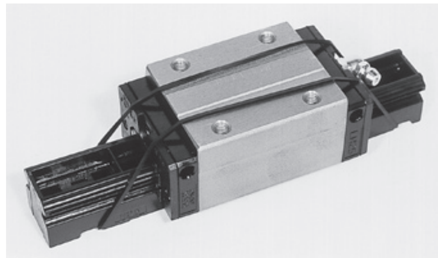


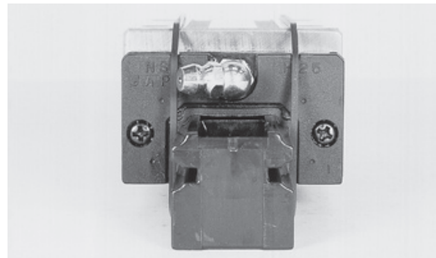
The ball slides are designed with retainers to prevent the balls from falling out when they are removed from the rail. However, NSK recommends that the ball slide should be stored on a provisional rail prior to installation to prevent contamination from dust and other foreign objects.



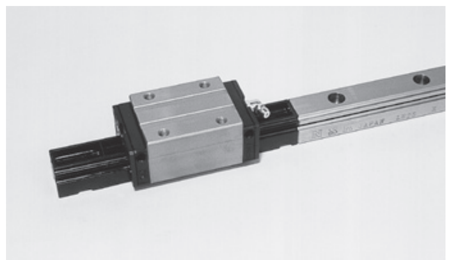
The following is a description of how the ball slide should be removed from and replaced on the linear guide rail.

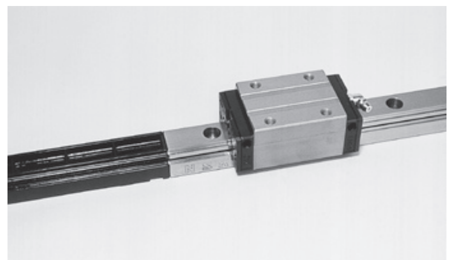
The ball slide is held on the provisional rail using a rubber band. The rubber band should catch the bottom channel in the provisonal rail and then twist around to secure the ball slide.



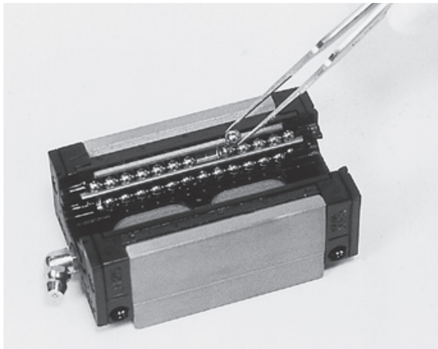


When transferring the ball slide from the provisional rail onto the rail, or vice versa, butt the provisional rail up against the rail and slide the ball slide directly from one onto the other. It is a good idea to secure the ball slide onto the provisional rail with a rubber band after removal from the rail.





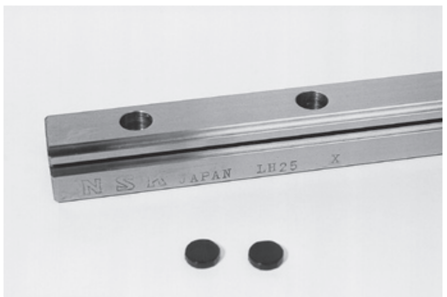
If a ball is accidentally dropped from the ball slide, it should be cleaned and replaced to the appropriate groove. The correct groove can be determined by the size of the clearance between the balls (the groove missing the ball will have greater clearance than the other grooves). It is normal to have a gap of 1.5 ball diameters in each groove.



The following section describes how to install the linear guides on the machine.

Ball slides and rails are supplied separately. Each is wrapped in vinyl sheet, and packed in a container. Each container has a certificate of inspection included.

Caps for rail mounting holes are available upon request.

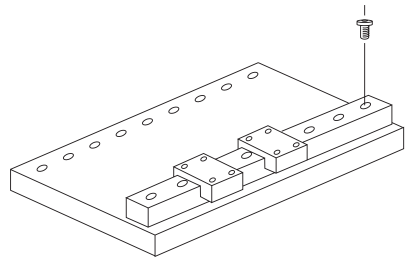


The certificate of inspection included with every rail and ball slide is NSK's guarantee of quality. If you should have any questions about the quality, please feel free to contact your local NSK branch office.

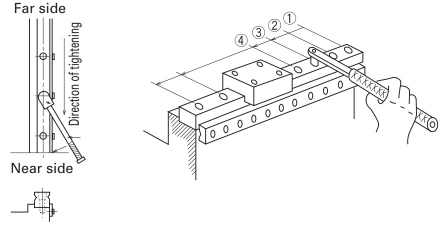
The rail is always shipped with rust preventive oil, which should be wiped off with a clean soft cloth before applying grease to the rail. Ball slides are pre-packed with NSK standard grease, so no cleaning is required prior to installation.

Now the linear guide is ready for installation. Put it on a mounting surface.

Temporarily tighten its mounting bolts lightly so that the rail's bottom is firmly against the base.



Then tighten the bolts firmly with torque wrench to the specified torque starting from the one end.

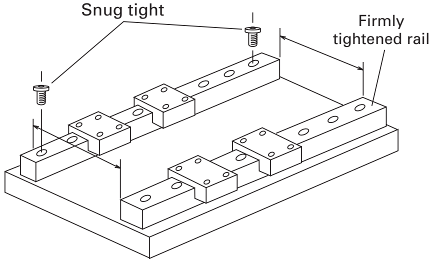


In NSK linear guides, the mounting holes are processed after heat treatment using a precision machining center; therefore, the hole pitch accuracy is as good as the positioning accuracy of the machine, which is considered very good.

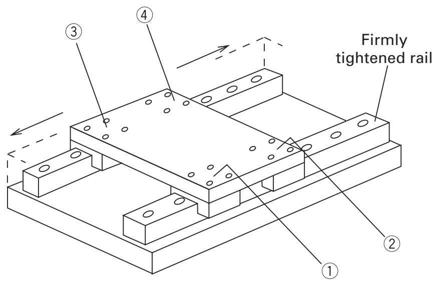
When installing a linear guide rail on a flat surface the same as this case, the rail tends to be slightly bent in the shape of S letter if the bolts are tightened indiscriminately starting near the middle because of friction at the seat of bolt head. NSK recommends that the bolts be tightened starting at one end with the wrench as shown in the above figure.

The rail that has been tightened can now be used as a reference rail. Using a vernier calipers or other accurate tool, measure the distance between the two rails, and adjust each end until they are the same. Tighten a bolt snugly at each end of the rail.

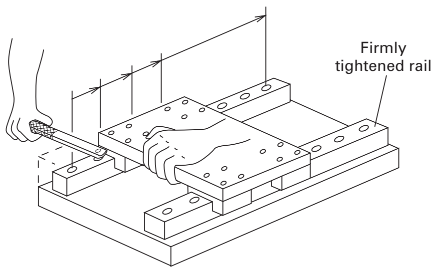
The next step is to install the table, and to use the table to align the rails.



Firmly bolt the table to ball slides 1 and 2 on the firmly secured rail as shown in the diagram. Then position ball slide 3 at the left end of the adjusting rail, and bolt the table to this ball slide. Move the ball slide 3 to right and bolt the table to the ball slide 4.



Move the table to one end of the rails, and start tightening the adjusting rail bolts sequentially to the specified torque while checking excessive friction of table movement. Continue moving the table down the rail tightening each adjacent bolt until they have all been tightened.



If you removed rust preventive oil or grease from surfaces of the linear guides when installing linear guides, we recommend supplying a rust preventive oil or grease on rail surfaces after installation.

As described above, installation of the linear guides is not difficult work if you carefully follow the above procedure.

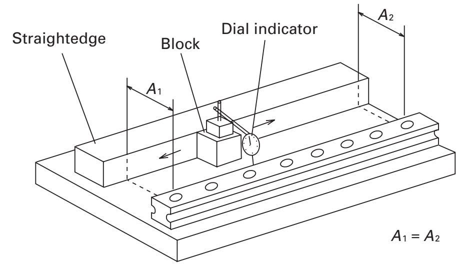
However, objective of the preceding procedure is only for an assembly of the table that moves smoothly. If you need to control motion accuracy of the table (straightness), it requires to add the following procedure.

When bolting the first rail on the machine base, align it straight using a straightedge and a dial indicator.

Bolt on the rail at the both ends lightly, and position a straightedge beside it. Set the straightedge parallel to the rail measuring distance A1 and A2 by a vernier calipers or some other accurate measuring tool.

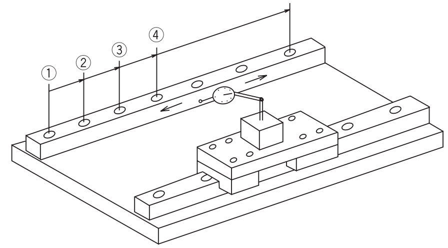
Move the dial indicator along the straightedge, and take readings at every bolt hole along the rail. Make fine adjustment of the rail to the straightedge until the desired reading is made, and tighten the bolt to the specified torque.

When all of the bolts have been tightened, slide the dial indicator from one end of the rail to the other to ensure that the desired straightness has been achieved.



Position the dial indicator on two ball slides on the reference rail as shown in the diagram. Tighten bolts of the adjusting side rail sequentially from the one end while noting the reading of the dial indicator.

Straightness of NSK linear guides is controlled so that it can be easily adjusted manually for easy installation.



In order to maintain stable production of the tables, we recommend to install the linear guides while checking the alignment accuracy quantitatively even smooth operation is the least requirement.

As the final part of the manual, this section describes the allowable tolerances for installation in order to maximize the performance of NSK linear guides.

We recommend that the mounting errors e_1 and e_2 do not exceed the values shown in the table below.

If the errors are smaller than the values in the preceding tables, there should be no trouble. Naturally, errors should be as small as possible to achieve the highest performance and reliability of your products.

The procedure for installing linear guides is not too difficult, but care is required. In case of an improper installation, it is necessary to remove them and check all the related parts; however, we hope this will never be necessary.
